1 Overview

Jz4755 is a multimedia application processor targeting for mobile devices like PMP, mobile digital TV, and GPS. Incorporating the XBurst[®] CPU core based on leading micro-architecture technology, this processor provides high integration, high performance and low power consumption solution for embedded device.

This SOC introduces an innovative dual-core architecture to handle mobile computing and high quality video application. The main XBurst CPU core, with 16K instruction cache and 16K data cache operating at 360MHz, performs OS related tasks. The auxiliary XBurst core, in together with the on chip video accelerators and Image Processing Unit, undertake the multimedia tasks.

The memory interface supports a variety of memory types that allow flexible design requirements, include the glueless connection to SLC/4-bit MLC/8-bit MLC NAND Flash for cost sensitive applications. On-chip modules such as LCD controller, audio CODEC, multi-channel SAR-ADC, AC97/I2S controller, TS interface and camera interface offer designers a rich suite of peripherals for multimedia application. TV encoder unit and 3 channels 10-bits DACs provide composite/S-video/component TV signal output in PAL or NTSC format. In addition, XVGA output up to 1024x768 is provided. WLAN, Bluetooth and expansion options are supported through high-speed SPI and MMC/SD/SDIO host controllers. And the other peripherals such as USB 2.0 device, UART and SPI as well as general system resources provide enough computing and connectivity capability for many applications.

1.1 Block Diagram

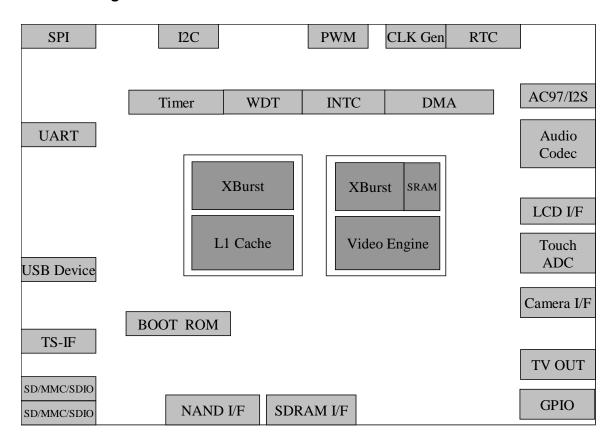

Figure 1-1 Jz4755 Diagram

1.2 Features

1.2.1 Main CPU core

- Master CPU core, boot system from this core
- XBurst[®] RISC instruction set to support Linux and WinCE
- XBurst[®] SIMD instruction set to support multimedia acceleration
- XBurst[®] 8-stage pipeline micro-architecture up to 360MHz
- 16K I-Cache, 16K D-Cache
- 32-entry dual-pages joint-TLB, 4 entry Instruction TLB and 4 entry data TLB
- 16KB tightly coupled memory with a dedicated descriptor DMA

1.2.2 Aux CPU core

- Slave CPU core, a powerful auxiliary for master CPU core
- XBurst[®] RISC instruction set to support Linux and WinCE
- XBurst[®] SIMD instruction set to support multimedia acceleration
- XBurst[®] 8-stage pipeline micro-architecture up to 360MHz
- 32KB tightly coupled memory with a dedicated descriptor DMA
- Simple hardware spinlock method supports complicated resource sharing
- A dedicated IRQ supports asynchonous communication with master CPU core

1.2.3 Multimedia support

- Video accelerator
 - Motion compensation
 - Motion estimation
 - De-block
 - DCT/IDCT for 4x4 block
- IPU (Image Processing Unit)
 - Video frame resize
 - Color space conversion: 420/444/422 YUV to RGB convert

1.2.4 Memory sub-system

- NAND Flash interface
 - Support 4-bit/8-bit MLC NAND as well as SLC NAND
 - Support all 8-bit/16-bit NAND Flash devices regardless of density and organization
 - Support automatic boot up from NAND Flash devices
- Synchronous DRAM Interface
 - Standard SDRAM and Mobile SDRAM
 - Programmable size and base address
 - 32-bit or 16-bit data bus width
 - Multiplexes row/column addresses according to SDRAM capacity

- Two-bank or four-bank SDRAM is supported
- Supports auto-refresh and self-refresh functions
- Supports power-down mode to minimize the power consumption of SDRAM
- Supports page mode
- 1 Chip select
- Direct Memory Access Controller
 - Eight independent DMA channels
 - Descriptor supported
 - Transfer data units: 8-bit, 16-bit, 32-bit, 16-byte or 32-byte
 - Transfer requests can be: auto-request within DMA; and on-chip peripheral module request
 - Interrupt on transfer completion or transfer error
 - Supports two transfer modes: single mode or block mode
- 8kB Boot ROM memory
- The Jz4755 processor system supports little endian only

1.2.5 Clock generation and power management

- On-chip oscillator circuit for an 32768Hz clock and an 24MHz clock
- On-chip phase-locked loops (PLL) with programmable multiple-ratio. Internal counter are used to ensure PLL stabilize time
- PLL on/off is programmable by software
- ICLK, PCLK, HCLK, HHCLK, MCLK and LCLK frequency can be changed separately for software by setting division ratio
- Supports six low-power modes and function: NORMAL mode; DOZE mode; IDLE mode;
 SLEEP mode; HIBERNATE mode; and MODULE-STOP function.

1.2.6 On-chip peripherals

- General-Purpose I/O ports
 - Total GPIO pin number is 125
 - Each pin can be configured as general-purpose input or output or multiplexed with internal chip functions
 - Each pin can act as a interrupt source and has configurable rising/falling edge or high/low level detect manner, and can be masked independently
 - Each pin can be configured as open-drain when output
 - Each pin can be configured as internal resistor pull-up
- RTC (Real Time Clock)
 - 32-bit second counter
 - 1Hz from 32768hz
 - Alarm interrupt
 - Independent power
 - A 32-bits scratch register used to indicate whether power down happens for RTC power

Interrupt controller

- Total 32 maskable interrupt sources from on-chip peripherals and external request through GPIO ports
- Interrupt source and pending registers for software handling
- Unmasked interrupts can wake up the chip in sleep or standby mode

Timer and counter unit with PWM output

- Provide six separate channels
- 16-bit A counter and 16-bit B counter with auto-reload function every channel
- Support interrupt generation when the A counter underflows
- Three clock sources: RTCLK (real time clock), EXCLK (external clock input), PCLK (APB Bus clock) selected with 1, 4, 16, 64, 256 and 1024 clock dividing selected
- Four PWM outputs

OS Timer

- One channel
- 32-bit counter and 32-bit compare register
- Support interrupt generation when the counter matches the compare register
- Three clock sources: RTCLK (real time clock), EXCLK (external clock input), PCLK (APB Bus clock) selected with 1, 4, 16, 64, 256 and 1024 clock dividing selected

Watchdog timer

- 16-bit counter in RTC clock with 1, 4, 16, 64, 256 and 1024 clock dividing selected
- Generate power-on reset

LCD controller

- Single-panel display in active mode, and single- or dual-panel displays in passive mode
- TV-out in NTSC or PAL, CVBS or S-video or Component signals
- 2, 4, 16 grayscales and up to 4096 colors in STN mode
- 2, 4, 16, 256, 4K, 32K, 64K, 256K and 16M colors in TFT mode
- 24-bit data bus
- Support 1,2,4,8 pins STN panel, 16bit, 18bit and 24bit TFT and 8bit I/F TFT
- Display size up to 1280×1024 pixels
- 256×16 bits internal palette RAM
- Support ITU601/656 data format
- Support smart LCD (SRAM-like interface LCD module)
- Support delta RGB
- One single color background and two foreground OSD

AC97/I2S controller

- Supports 8, 16, 18, 20 and 24 bit for sample for AC-link and I2S/MSB-Justified format
- DMA transfer mode support

- Support variable sample rate mode for AC-link format
- Power down mode and two wake-up mode support for AC-link format
- Programmable Interrupt function support
- Support the on-chip CODEC
- Support off-chip CODEC

Camera interface module

- Input image size up to 4096×4096 pixels
- Supports CCIR656 data format
- Bayer RGB, YCbCr 4:2:2 and YCbCr 4:4:4 data format
- 32×32 image data receive FIFO with DMA support

• On-chip audio CODEC

- 24-bit DAC, SNR: 90dB
- 24-bit ADC, SNR: 85dB
- Sample rate: 8/9.6/11.025/12/16/22.05/24/32/44.1/48/96kHz
- L/R channels line input
- MIC input
- L/R channels headphone output amplifier support up to 16ohm load
- Capacitor-coupled

SADC

- 12-bit, 2Mbps, SNR@500kHz is 61dB, THD@500kHz is -71dB
- XP/XN, YP/YN inputs for touch screen
- Battery voltage input
- 1 generic input channel

Two MMC/SD/SDIO controllers (MSC0, MSC1)

- Support automatic boot up from MSC0, which has 4-bit data bus
- MSC1 with 4-bit data bus
- Compliant with "The MultiMediaCard System Specification version 4.2"
- Compliant with "SD Memory Card Specification version 2.0" and "SDIO Card Specification version 1.0" with 1 command channel and 4 data channels
- Up to 320 Mbps data rate in MSC0
- Up to 320 Mbps data rate in MSC1
- Supports up to 10 cards (including one SD card)
- Maskable hardware interrupt for SD I/O interrupt, internal status, and FIFO status

I2C bus interface

- Only supports single master mode
- Supports I2C standard-mode and F/S-mode up to 400 kHz
- Double-buffered for receiver and transmitter
- Supports general call address and START byte format after START condition

Synchronous serial interface

- Up to 50MHz speed
- Supports three formats: TI's SSP, National Microwire, and Motorola's SPI
- Configurable 2 17 (or multiples of them) bits data transfer
- Full-duplex/transmit-only/receive-only operation
- Supports normal transfer mode or Interval transfer mode
- Programmable transfer order: MSB first or LSB first
- 17-bit width, 128-level deep transmit-FIFO and receive-FIFO
- Programmable divider/prescaler for SSI clock
- Back-to-back character transmission/reception mode

UART

- 5, 6, 7 or 8 data bit operation with 1 or 1.5 or 2 stop bits, programmable parity (even, odd, or none)
- 32x8bit FIFO for transmit and 32x11bit FIFO for receive data
- Interrupt support for transmit, receive (data ready or timeout), and line status
- Supports DMA transfer mode
- Provide complete serial port signal for modem control functions
- Support slow infrared asynchronous interface (IrDA)
- IrDA function up to 115200bps baudrate
- UART function up to 3.7Mbps baudrate
- Hardware flow control

USB 2.0 device interface

- Compliant with USB protocol revision 2.0
- High speed and full speed supported
- Embedded USB 2.0 PHY

TS slave interface

- 8-bit or 1-bit data bus selectable
- Support PID filtering

1.3 Characteristic

Item	Characteristic
Process Technology	0.18um CMOS
Power supply voltage	I/O: 3.3 ± 0.3V
	Core: 1.8 ± 0.2
Package	LQFP176, 20mm x 20mm x 1.4mm, 0.4mm pitch
Operating frequency	360MHz
Power consumption	400mw @ 360MHz

2 CPU Core

At the heart of the chip, there are two JzRISC processor cores, main CPU core and AUX CPU core. Main CPU is the master and AUX is the slave. JzRISC adopts a brand new micro-architecture which provides superior performance and power consumption than existent industry cores. Detailed description of JzRISC cores is specified in document titled "JzRISC Core User Manual"

Key features of JzRISC cores implemented in this chip are as following:

Table 2-1 The Main JzRISC Core Features

Item	Features
RISC ISA	Industry standard Instruction set architecture
	32 32-bit general purpose registers
Ingenic Media ISA	Implement 114 SIMD like instructions for multimedia acceleration
	See document "JZ SIMD Instruction Set"
Ingenic Floating Point ISA	Not implemented
Multiply-Divide Unit	Maximum issue rate of one 32x16 multiply every clock
(MDU)	Maximum issue rate of one 32x32 multiply every other clock
	Minimum 2 clock cycle, maximum 34 clock cycles for division
Memory Manager Unit	4 G-Bytes of address space
(MMU)	32/16 dual-entry full associative joint TLB plus 4 dual-entry ITLB and 4
	dual-entry DTLB respectively
	7 different page size from 4Kb to 16MB supported in any entry
	Support entry lock
	Space identifier ASID: 8 bits
Data Cache	Physically-indexed, physically-tagged
	4 way, 8-word line, alterable size: 4K, 8K, 16K bytes
	LRU replacement algorithm
	Write-back, write-through
	16-word depth write buffer
Instruction Cache	Physically-indexed, physically-tagged
	4 way, 8-word line, alterable size: 4K, 8K, 16K bytes
	LRU replacement algorithm
Debug&JTAG	JTAG interface to host machine
	ACC mode to accelerate JTAG memory access
	Two instruction and one data breakpoints
Branch Target Buffer	Virtally-tagged
(BTB)	Up to 64 entry direct mapped
	2-bit branch history maintained
Bus Interface	compliance with AHB protocol

Tightly	coupled	sharing	High speed 16KB on-chip SRAM (same freqency as CPU)						
memory	(TCSM)		4 banks support concurrent accessing by CPU and other AHB masters						
Dedicate	ed DDMA		Descriptor DMA tightly coupled with TCSM						
			Transport data between TCSM and other AHB slaves						
			Support 2-dimensional array transfer

3 External Memory Controller

3.1 Overview

The External Memory Controller (EMC) divides the off-chip memory space and outputs control signals complying with specifications of various types of memory and bus interfaces. It enables the connection of static memory, NAND flash memory, synchronous DRAM, etc., to this processor.

Static memory interface

- Direct interface to ROM, Burst ROM, SRAM and NOR Flash.
- Support 4 external chip selection CS4~1#. Each bank can be configured separately.
- The size and base address of static memory banks are programmable.
- Output of control signals allowing direct connection of memory to each bank. Write strobe setup time and hold time periods can be inserted in an access cycle to enable connection to low-speed memory
- Wait state insertion can be controlled by program.
- Wait insertion by WAIT pin.
- Automatic wait cycle insertion to prevent data bus collisions in case of consecutive memory accesses to different banks, or a read access followed by a write access to the same bank

NAND flash interface

- Support on CS4~CS1, sharing with static memory bank4~bank1.
- Support most types of NAND flashes, including 8-bit and 16-bit bus width, 512B and 2KB page size. For 512B page size, 3 and 4 address cycles are supported. For 2KB page size, 4 and 5 address cycles are supported.
- Support read/erase/program NAND flash memory.
- Support boot from NAND flash.

SDRAM Interface

- Support 2 chip selection DCS0# and DCS1#.
- Support both 32-bit and 16-bit bus width.
- Support both two-bank and four-bank type SDRAM.
- Support burst operation.
- Support both auto-refresh and self-refresh functions.
- The size and base address of each bank is configurable.
- Multiplexes row/column addresses according to SDRAM capacity
- Controls timing of SDRAM direct-connection control signals according to register setting
- Supports power-down mode to minimize the power consumption of SDRAM
- Support page mode

3.2 Pin Description

Following table list the EMC pins.

Table 3-1 EMC Pin Description

Pin Name	I/O	Signal	Description
Data Bus	I/O	D31 – D0	Data I/O
Address bus	0	A25-A0	Address output
Static chip	0	CS4~1#	Chip select signal that indicates the static bank being
select 4 ~ 1			accessed
SDRAM chip	0	DCS0#	Chip select signal that indicates the SDRAM bank being
select			accessed
SDRAM chip	0	DCS1#	Chip select signal that indicates the SDRAM bank being
select			accessed
Read enable	0	RD#/	For Static memory read enable signal
Write enable	0	WE# /	Static memory write enable signal
Column address strobe	0	CAS#	SDRAM column address strobe signal
Row address	0	RAS#	SDRAM row address strobe signal
strobe		NAO#	SDRAW TOW address strope signal
Read/write	0	RD/WR#	Data bus direction designation signal
rcad/write		IND/WIN	Also used as SDRAM write enable signal
Byte enable 0	0	WE0# /	For non-byte-control static memory , D7-0 write enable
			signal,
		BE0# /	For byte-control static memory , D7-0 selection signal
		DQM0 /	For SDRAM, D7–D0 selection signal
Byte enable 1	0	WE1# /	For non-byte-control static memory , D15-8 write enable signal
		BE1# /	For byte-control static memory , D15-8 selection signal
		DQM1/	For SDRAM, D15–D8 selection signal
Byte enable 2	0	WE2# /	For non-byte-control static memory, D23-16 write enable signal
		BE2# /	For byte-control static memory, D23-16 selection signal
		DQM2 /	For SDRAM , D23–D16 selection signal
Byte enable 3	0	WE3# /	For static memory , D31-24 write enable signal
		BE3# /	For byte-control static memory , D31-24 selection signal
		DQM3	For SDRAM, D31–D24 selection signal.
SDRAM Clock	0	CKE	Enable the SDRAM clock
enable			
SDRAM Clock	0	СКО	SDRAM clock
Wait	I	Wait# /	External wait state request signal for memory-like devices
NAND flash	0	FRE#	NAND flash read enable signal
read enable			
NAND flash	0	FWE#	NAND flash write enable signal
write enable			
NAND flash	I	FRB#	Indicates NAND flash is ready or busy (When Nand flash
ready/busy			boot, GPC30 is used as FRB# of CS1#)

3.3 Physical Address Space Map

Both virtual spaces and physical spaces are 32-bit wide in this architecture. Virtual addresses are translated by MMU into physical address which is further divided into several partitions for static memory, SDRAM, and internal I/O.

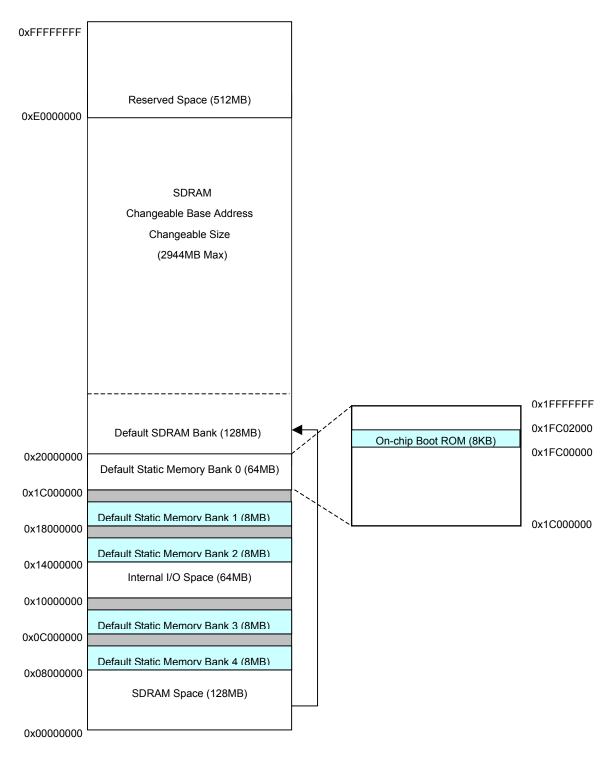

Figure 3-1 Physical Address Space Map

Table 3-2 Physical Address Space Map

Start Address	End Address	Connectable Memory	Capacity
H'0000 0000	H'07FF FFF	SDRAM space	128 MB
H'0800 0000	H'0FFF FFFF	Static memory space	128 MB
H'1000 0000	H'13FF FFFF	Internal I/O space	64 MB
H'1400 0000	H'1BFF FFFF	Static memory space	128MB
H'1C00 0000	H'1FBF FFFF	Un-used	60MB
H'1FC0 0000	H'1FC0 1FFF	On-chip boot ROM	8KB
H'1FC0 1000	H'1FFF FFFF	Un-used	4095KB
H'2000 0000	H'BFFF FFFF	SDRAM space	2944 MB
H'D000 0000	H'FFFF FFFF	Reserved space	512 MB

The base address and size of each memory banks are configurable. Software can re-configure these memory banks according to the actual connected memories. Following table lists the default configuration after reset.

Table 3-3 Default Configuration of EMC Chip Select Signals

Chip-Selec	Connected Memory	Capacit	Memory	Start	End Address				
t Signal		у	Width *1	Address					
CS1#	Static memory bank 1	8 MB	8, 16, 32	H'1800 0000	H'1BFF FFFF				
CS2#	Static memory bank 2	8 MB	8, 16, 32	H'1400 0000	H'17FFFFFF				
CS3#	Static memory bank 3	8 MB	8, 16, 32	H'0C00 0000	H'0FFF FFFF				
CS4#	Static memory bank 4	8 MB	8, 16, 32	H'0800 0000	H'0BFF FFFF				
DCS0#*3	SDRAM bank	128 MB	16, 32	H'2000 0000	H'27FF FFFF				
DCS1# ^{*3}	SDRAM bank	128 MB	16, 32	H'2800 0000	H'2FFF FFFF				

Notes:

- 1) Data width of static memory banks can be configured to 8, 16 or 32 bits by software.
- 2) The 8KB address space from H'1FC00000 to H'1FC01FFF in bank 0 is mapped to on-chip boot ROM. The other memory spaces in bank 0 are not used.
- 3) To support large SDRAM space, EMC re-maps the physical address H'00000000-H07FFFFFF to H'20000000-H'27FFFFF. Software must configure the SDRAM base address by the re-mapped address.

3.4 Static Memory Interface

The static memory controller provides a glueless interface to SRAM's, ROMs (PROMs/EPROMs/FLASH), dual port memory, IO devices, and many other peripherals devices. It can directly control up to 4 devices using four chip select lines. Additional devices may be supported through external decoding of the address bus. The Device Controller shares the data and address busses with the SDRAM controller. Thus, only one memory subsection (SDRAM, memory, or IO) can be active at any time.

Each chip select can directly access memory or IO devices that are 8-bits, 16-bits, or 32-bits wide. Each device connected to a chip select line has 2 associated registers that control its operation and the access timing to the external device. The Static Memory Control Register SMCRn specifies various configurations for the device. The Static Memory Address Configuration Register SACRn specifies the base address and size for each device, enabling any device to be located anywhere in the physical address range.

The static memory interface includes the following signals:

- Four chip selects, CS4~1#
- Twenty-six address signals, A25-A0
- One read enable, RD#
- One write enable, WE#
- Four byte enable, BE3~1#
- One wait pin, WAIT#

The SMT field in SMCRn registers specifies the type of memory and BW field specifies the bus width. BOOT_SEL[1:0] defines whether system boot from Nor or Nand flash and the page size when boot from Nand flash.

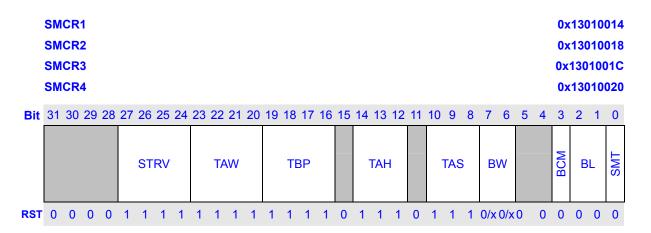

3.4.1 Register Description

Table 3-4 Static Memory Interface Registers

Name	Description	RW	Reset Value	Address	Access Width
SMCR1	Static memory control register 1	RW	0x0FFF7700	0x13010014	32
SMCR2	Static memory control register 2	RW	0x0FFF7700	0x13010018	32
SMCR3	Static memory control register 3	RW	0x0FFF7700	0x1301001C	32
SMCR4	Static memory control register 4	RW	0x0FFF7700	0x13010020	32
SACR1	Static memory bank 1 address configuration register	RW	0x000018FC	0x13010034	32
SACR2	Static memory bank 2 address configuration register	RW	0x000016FE	0x13010038	32
SACR3	Static memory bank 3 address configuration register	RW	0x000014FE	0x1301003C	32
SACR4	Static memory bank 4 address configuration register	RW	0x00000CFC	0x13010040	32

3.4.1.1 Static Memory Control Register (SMCR1~4)

SMCR1~4 are 32-bit read/write registers that contain control bits for static memory. On reset, SMCR1~4 are initialized to 0x0FFF7700.

Bits	Name	Description	RW
31:28	Reserved	Writes to these bits have no effect and always read as 0.	R
27:24	STRV	Static Memory Recovery Time: Its value is the number of idle cycles	RW
		(0~15 cycles) inserted between bus cycles when switching from one bank	
		to another bank or between a read access to a write access in the same	
		bank. Its initial value is 0xF (15 cycles).	
23:20	TAW	Access Wait Time: For normal memory, these bits specify the number of wait cycles to be inserted in read strobe time. For burst ROM, these bits	RW
		specify the number of wait cycles to be inserted in first data read strobe	
		time.	

		TAW3~() Wait cycle	Wait# Pin							
		0000	0 cycle	Ignored							
		0001	1 cycle	Enabled							
		0010	2 cycles	Enabled							
		0011	3 cycles	Enabled							
		0100	4 cycles	Enabled							
		0101	5 cycles	Enabled							
		0110	6 cycles	Enabled							
		0111	7 cycles	Enabled							
		1000	8 cycles	Enabled							
		1001	9 cycles	Enabled							
		1010	10 cycles	Enabled							
		1011	12 cycles	Enabled							
		1100	15 cycles	Enabled							
		1101	20 cycles	Enabled							
		1110	25 cycles	Enabled							
		1111	31 cycles	Enabled (Initial Value)							
19:16	TBP	Burst Pitch	Time: For bur	st ROM, these bits specify the number of wait	RW						
		cycles to be	inserted in sub	sequent access. For normal memory, these							
		bits specify the	he number of v	wait cycles to be inserted in write strobe time.							
		TBP3~0	Wait cycle	Wait# Pin							
		0000	0 cycle	Ignord							
		0001	1 cycle	Enabled							
		0010	2 cycles	Enabled							
		0011	3 cycles	Enabled							
		0100	4 cycles	Enabled							
		0101	5 cycles	Enabled							
		0110	6 cycles	Enabled							
		0111	7 cycles	Enabled							
		1000	8 cycles	Enabled							
		1001	9 cycles	Enabled							
		1010	10 cycles	Enabled							
		1011	12 cycles	Enabled							
		1100	15 cycles	Enabled							
		1101	20 cycles	Enabled							
		1110	25 cycles	Enabled							
		1111	31 cycles	Enabled (Initial Value)							
15	Reserved	Writes to the	se bits have n	o effect and always read as 0.	R						
14:12	TAH	Address Ho	Id Time: Thes	se bits specify the number of wait cycles to be	RW						
		inserted from	negation of re	ead/write strobe to address.							
		TAH2~0	Wait cycle

		11	32 consecutive accesses. Can only be used with 8-bit bus								
			width								

0	SMT	Static Memo	ory Type (SMT): This bit specifies the type of static memory.	RW
		SMT	Description	
		0	Normal Memory (Initial Value)	
		1	Burst ROM	

3.4.1.2 Static Bank Address Configuration Register (SACR1~4)

SACR1~4 defines the physical address for static memory bank 1 to 4, respectively. Each register contains a base address and a mask. When the following equation is met:

(physical_address [31:24] & MASK_n) == BASE_n

The bank n is active. The *physical_address* is address output on internal system bus. Static bank regions must be programmed so that each bank occupies a unique area of the physical address space. Bank 0 base address must be 0 because it's system boot address. Programming overlapping bank regions will result in unpredictable error. These registers are initialized by a reset.

	SACR1 SACR2 SACR3 SACR4														0 x′	130	100		0x1	301 301 301	00	38								
Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14 1	12 BAS	10	9	8	7	6		4 MA		2	1	0

Bits	Name	Description		RW				
31:16	Reserved	Writes to these bits have no	Writes to these bits have no effect and read always as 0.					
15:8	BASE	Address Base: Defines the base address of Static Bank n (n = 1 to 4).						
		The initial values are:						
		SACR1.BASE	0x18					
		SACR2.BASE	0x14					
		SACR3.BASE	0x0C					
		SACR4.BASE	0x08					
23:20	MASK	Address Mask: Defines the	mask of Static Bank n (n = 1 to 4).	RW				
		The initial values are:						
		SACR1.MASK	0xFC					
		SACR2.MASK	0xFC					
		SACR3.MASK	0xFC					
		SACR4.MASK	0xFC					

3.4.2 Example of Connection

Following figures shows examples of connection to 32-, 16- and 8-bit data width normal memory.

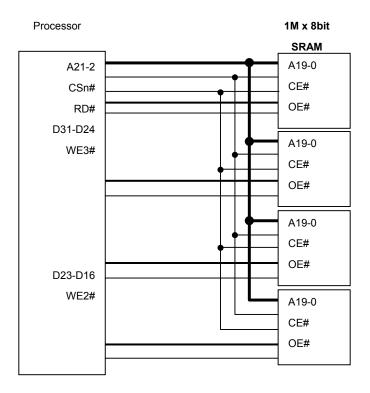

Figure 3-2 Example of 32-Bit Data Width SRAM Connection

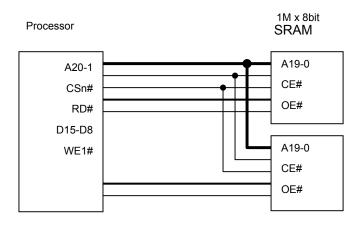

Figure 3-3 Example of 16-Bit Data Width SRAM Connection

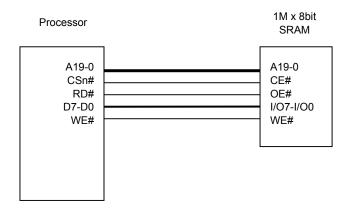

Figure 3-4 Example of 8-Bit Data Width SRAM Connection

3.4.3 Basic Interface

When SMT field in SMCRn (n = 1 to 4) is 0 and BCM field is 0, normal memory (non-burst ROM, Flash, normal SRAM or memory-like device) is connected to bank n. When bank n (n = 1 to 4) is accessed, CSn# is asserted as soon as address is output. In addition, the RD# signal, which can be used as OE#, and write control signals, WE0# to WE3#, are asserted.

The TAS field in SMCRn is the latency from CSn# to read/write strobe. The TAW3 field is the delay time of RD# in read access. TBP3~0 field is the delay time of WE# and WEn# in write access. In addition, any number of waits can be inserted by means of the external pin (WAIT#). The TAH field is the latency from RD# and WEn# negation to CSn# negation, also the hold time to address and write data.

All kinds of normal memories (non-burst ROM, normal SRAM and Flash) have the same read and write timing. There are some requirements for writes to flash memory. Flash memory space must be un-cacheable and un-buffered. Writes must be exactly the width of the populated Flash devices on the data bus (no byte writes to a 32-bit bus or word writes to a 16-bit bus, and so on). Software is responsible for partitioning commands and data, and writing them out to Flash in the appropriate sequence.

Glossary

Th - hold cycle

Tw - wait cycle

Ts - setup cycle

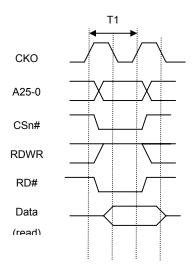

T1 - read inherent cycle or first write inherent cycle

T2 - last write inherent cycle

Tb - burst read inherent cycle

Following figures show the timing of normal memory. A no-wait read access is completed in one cycle and a no-wait write access is completed in two cycles. Therefore, there is no negation period in case of access at minimum pitch.

*In this example, SMCRn:MT = 0, BCM = 0, TAS = 0, TAW = 0, TAH = 0

Figure 3-5 Basic Timing of Normal Memory Read

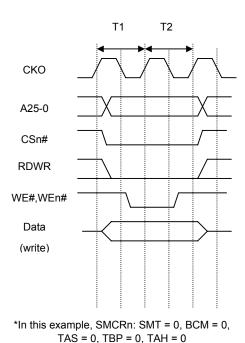

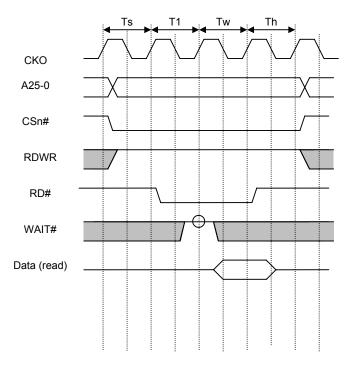

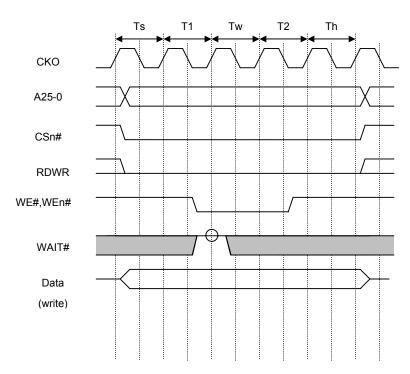

Figure 3-6 Basic Timing of Normal Memory Write

*In this example, SMCRn: SMT = 0, BCM = 0, TAS = 1, TAW = 1, TAH = 1

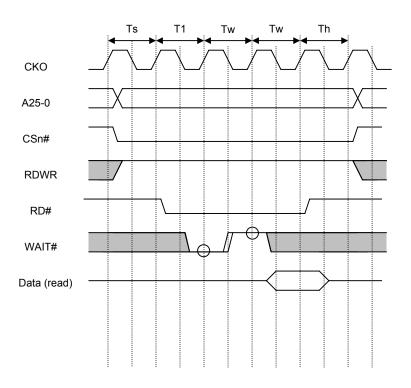

Figure 3-7 Normal Memory Read Timing With Wait (Software Wait Only)

*In this example, SMCRn: SMT = 0, BCM = 0, TAS = 1, TBP = 1, TAH = 1

Figure 3-8 Normal Memory Write Timing With Wait (Software Wait Only)

*In this example, SMCRn: SMT = 0, BCM = 0, TAS = 1, TAW = 1, TAH=1

Figure 3-9 Normal Memory Read Timing With Wait (Wait Cycle Insertion by WAIT# pin)

3.4.4 Byte Control

The byte control SRAM interface is a memory interface that outputs a byte select strobe WEn# in both read and write bus cycles. It has 16 bit data pins, and can be directly connected to SRAM which has an upper byte select strobe and lower byte select strobe function such as UB# and LB#.

In read/write access, RD#/WE# is used as read/write strobe signal and WEn# are used as byte select signals.

Following figure shows an example of byte control SRAM connection to processor.

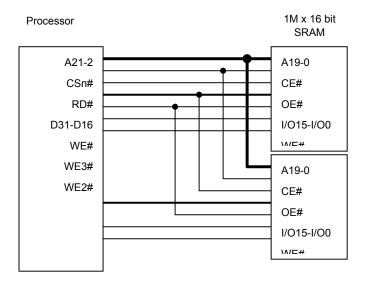

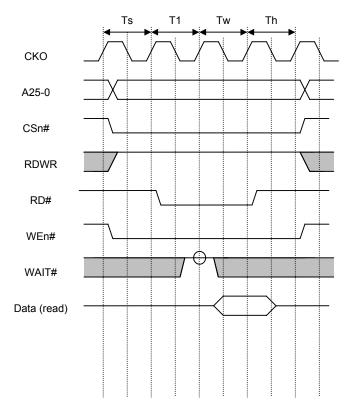

Figure 3-10 Example of 32-Bit Data Width Byte Control SRAM Connection

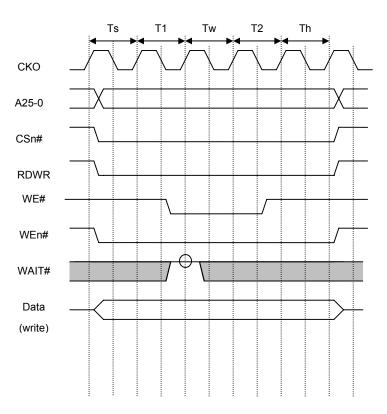

Following figures show examples of Byte Control SRAM timing.

*In this example, SMCRn: SMT = 0, BCM = 1, TAS = 1, TAW = 1, TAH = 1

Figure 3-11 Byte Control SRAM Read Timing

*In this example, SMCRn: SMT = 0, BCM = 1, TAS = 1, TBP = 1, TAH = 1

Figure 3-12 Byte Control SRAM Write Timing

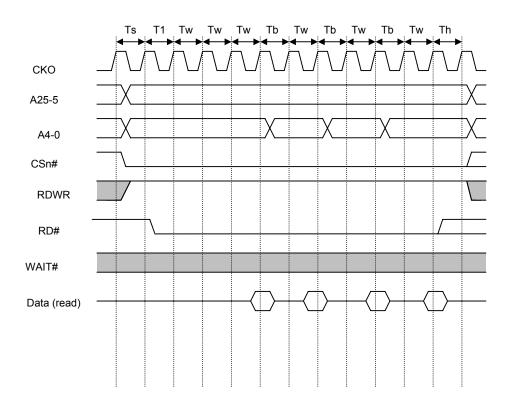

3.4.5 Burst ROM Interface

Setting SMT to 1 in SMCRn allows burst ROM to be connected to bank n (n = 1 to 4). The burst ROM interface provides high-speed access to ROM that has a nibble access function. Basically, access is performed in the same way as for normal memory, but when the first cycle ends, only the address is changed before the next access is executed. When 8-bit burst ROM is connected, the number of consecutive accesses can be set as 4, 8, 16, or 32 with bits BL1~0. When 16-bit ROM is connected, 4, 8, or 16 can be set in the same way. When 32-bit ROM is connected, 4 or 8 can be set.

For burst ROM read, TAW sets the delay time from read strobe to the first data, TBP sets the delay time from consecutive address to data. Burst ROM writes have the same timing as normal memory except TAW instead of TBP is used to set the delay time of write strobe.

WAIT# pin sampling is always performed when one or more wait states are set.

Following figures show the timing of burst ROM.

*In this example, SMT = 1, BL = 0, TAS = 1, TAW = 3, TBP = 1, TAH = 1

Figure 3-13 Burst ROM Read Timing (Software Wait Only)

3.5 NAND Flash Interface

NAND flash can be connected to static memory bank 4~ band 1. Both 8-bit and 16-bit NAND flashes are supported. A mechanism for booting from NAND flash is also supported.

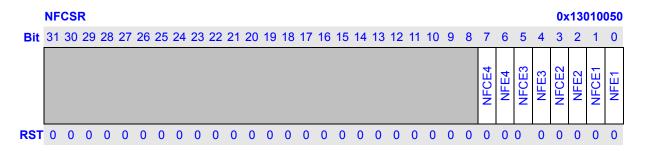

3.5.1 Register Description

Table 3-5 NAND Flash Interface Registers

Name	Description		Reset Value	Address	Access Width
NFCSR	NAND flash control/status register	RW	0x00000000	0x13010050	32

3.5.1.1 NAND Flash Control/Status Register (NFCSR)

NFCSR is a 32-bit read/write register that is used to configure NAND flash. It is initialized by any reset.

Bits	Name	Description	RW
31:16	Reserved	Writes to these bits have no effect and read always as 0.	R
1/3/5/	FCEn	NAND Flash FCE# Assertion Control : Controls the assertion of NAND	RW
7	(n=1,2,3,	Flash FCEn#. When set, FCEn# is always asserted until this bit is	
	4)	cleared. When the NAND flash require FCEn# to be asserted during read	
		busy time, this bit should be set	
		FCE Description	
		0 FCEn# is asserted as normal static chip enable(Initial	
		value)	
		1 FCEn# is always asserted	
0/2/4/	NFEn	NAND Flash Enable: Specifies if NAND flash is connected to static bank	RW
6	(n=1,2,3,	n. When system is configured to boot from NAND flash, this bit is	
	4)	initialized to 1.	
		NFE Description	
		Static bank n is not used as NAND flash.	
		2. Static bank n is used as NAND flash.	

3.5.2 NAND Flash Boot Loader

To support boot from NAND flash, 4KB on-chip Boot ROM is implemented. Following figure illustrates the structure of NAND Flash Boot Loader.

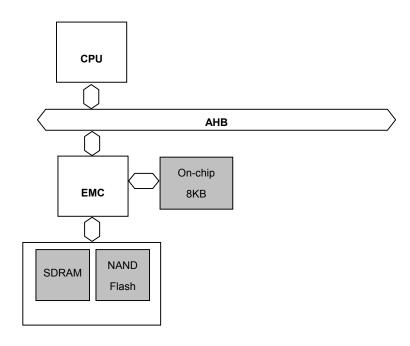

Figure 3-14 Structure of NAND Flash Boot Loader

When system is configured to boot from NAND flash, after reset, the program in Boot ROM is executed and the program will copy the first 8K bytes of NAND flash to internal memory for further initialization.

Generally, the boot code will copy more NAND flash content to SDRAM. Then the main program will be executed on SDRAM.

When system is configured to boot from NAND flash, software may know the nand flash page size through BOOT_SEL[1:0] pin.

3.5.3 NAND Flash Operation

Set NFEn bit of NAND Flash Control/Status Register (NFCSR) will enable access to NAND flash. The partition of static bank n (n=1~4) is changed as following figure. Writes to any of address space will be translated to NAND flash address cycle. Writes to any of command space will be translated to NAND flash command cycle. Caution: don't read to address and command space, and these two partitions should be uncacheable. Reads and writes to any of data space will be translated to NAND flash data read/write cycle. DMA access to data space is supported to increase the speed of data read/write. The DMA access cannot exceed the page boundary (512 bytes or 2K bytes) of NAND flash.

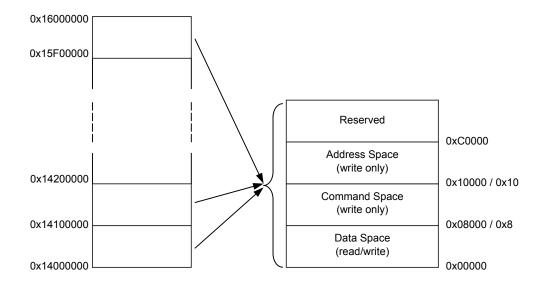

Figure 3-15 Static Bank 2 Partition When NAND Flash is Used (an example)

The timing of NAND flash access is configured by SMCRn and is same as normal static memory timing, except that CSn# is controlled by NFCE bit NFCSR. CSn# is always asserted when NFCE is 1. When NFCE is 0, CSn# is asserted as normal static memory access.

The control signals for direction connection of NAND flash are CSn#, FRE#, FWE#, FRB#(GPIO), A16 and A15. Following figure shows the connection between processor and NAND Flash.

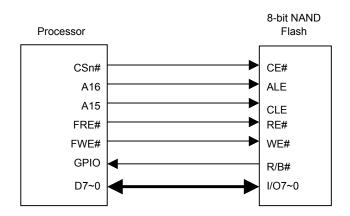

Figure 3-16 Example of 8-bit NAND Flash Connection

Note:

When BCR.BSR is 0, A16 is connected to ALE, A15 is connected to CLE, software should write 0x10000 for address space and 0x8000 for command space;

When BCR.BSR is 1, A4 is connected to ALE, A3 is connected to CLE, software should write 0x10 for address space and 0x8 for command space.

3.6 SDRAM Interface

The SDRAM controller provides a glueless interface to industry standard SDRAM chip. The SDRAM controller provides two chip selects DCS0~1# supporting 16-bit or 32-bit wide SDRAM.

Both 2-bank and 4-bank SDRAM modules are supported. The bank select signals are always output from the A13 pin and A14 pin of processor.

The SDRAM interface includes the following signals:

- Two chip selects, DCS0#, DCS1#
- Four byte mask signals, DQM3~0#
- 15 multiplexed bank/row/column address signals, A14-A0
- One write enable, RD/WR#
- One column-address strobe CAS#
- One row-address strobe RAS#
- One clock enable CKE
- One clock CKO

The processor performs auto-refresh (CBR) during normal operation and supports self-refreshing SDRAM during sleep, hibernate, and frequency-change modes. An SDRAM power-down mode bit (DMCR[PDM]]) can be set so that the CKO and the clock-enable signal CKE to SDRAM are automatically deasserted whenever none of the corresponding banks is being accessed.

3.6.1 Register Description

Table 3-6 SDRAM Registers

Name	Description	RW	Reset Value	Address	Access Width
DMCR	DRAM control register	RW	0x0000 0000	0x13010080	32
RTCSR	Refresh time control/status register	RW	0x0000	0x13010084	16
RTCNT	Refresh timer counter	RW	0x0000	0x13010088	16
RTCOR	Refresh time constant register	RW	0x0000	0x1301008C	16
DMAR1	SDRAM bank 0 address	RW	0x000020F8	0x13010090	32
	configuration register				
DMAR2	SDRAM bank 1 address	RW	0x000028F8	0x13010094	32
	configuration register				
SDMR	Mode register of SDRAM bank	W		0x1301-xxx	8
				(-: 4'b1xxx)	

3.6.1.1 SDRAM Control Register (DMCR)

DMCR is a 32-bit read/write register that specifies the timing, address multiplexing and refresh control of SDRAM. This enables direct connection of SDRAM without external circuits.

The DMCR is initialized to 0x00000000 by any resets. SDRAM bank should not be accessed until initialization is completed.

24	RFSH	Refresh Cor	ntrol.	RW					
		RFSH	Description						
		No refres	sh is performed (Initial value)						
		Refresh i	s performed						
23	MRSET	Mode Regis	ter Set: Set when a SDRAM mode register setting is used.	RW					
		When this bit	t is 0 and SDRAM mode register is written, a Pre-charge all						
		banks comm	and (PALL) is performed. When this bit is 1 and SDRAM						
		mode registe	er is written, a Mode Register Set command (MRS) is						
		performed.							
		MRSET	MRSET Description						
		All-bank							
		Mode reg	gister setting						
22	Reserved	Writes to the	se bits have no effect and always read as 0.	R					
21:20	RA	Row Addres	s Width: Specify the row address width of connected	RW					
		SDRAM.							
		RA	Description						
		00	11-bit row address (Initial value)						
		01	12-bit row address						
		10	13-bit row address						
		11	Reserved						
19	ВА	Bank Addres	ss Width: Specify the number of bank select signals for one	RW					
		chip select.							
		ВА	Description						
		0	1-bit bank address is used (2 banks each chip select)						
			(Initial value)						
		1	2-bit bank address is used (4 banks each chip select)						
18	PDM	Power Dowr	Mode: Set power-down mode. When power-down mode is	RW					
		set, SDRAM	will be driven to power-down mode when it is not accessing						
		and refreshin	g. Clock supply to SDRAM will be stopped also.						
		PDM	Description						
		0	Non-power-down mode (Initial value)						
	-			•					

		1 Power-down mode							
17	EPIN	CKE Pin Control: Controls the level of CKE pin. Clearing this bit by	RW						
17		software causes a power-down command (if CKOEN of CPM is 1).	1744						
		Caution: after power-down command, all commands except							
		power-down-exit are prohibited. Setting this bit by software causes a							
		power-down-exit command. Setting EPIN is a part of initializes procedure							
		for SDRAM.							
		EPIN Description							
		CKE pin is deserted (Initial value)							
		CKE pin is asserted							
16	MBSEL	Bank Select for Mode Register Load: It is used to distinguish to load	RW						
10	WIDOLL	which bank Mode register.	1744						
		Which bank wode register.							
		MBSEL Description							
		0 Bank 0 (Initial value)							
		1 Bank 1							
15:13	TRAS	RAS Assertion Time: When synchronous DRAM is connected, these	RW						
		bits set the minimum CKE negation time after self-refresh command is							
		issued.							
		TRAS Description							
		000 4 (Initial value)							
		001 5							
		010 6							
		011 7							
		100 8							
		101 9							
		110 10							
		111 11							
12:11	RCD	RAS-CAS Delay: Set the SDRAM bank active-read/write command	RW						
		delay time.							
		RCD Description							
		00 1(Initial value)							
		01 2							
		10 3							
		11 4							
10:8	TPC	RAS Precharge Time: Specify the minimum number of cycles until the	RW						
		next bank active command is output after precharging.							
		TPC Description							
		000 1 cycle (Initial value)							
		001 2 cycles							
		010 3 cycles							
		011 4 cycles							
		100 5 cycles							

		101	6 cycles					
		110	7 cycles					
		111	8 cycles					
7	Reserved	Writes to these	bits have no effect and always read as 0.	R				
6:5	TRWL	Write Precharge Time: Set the SDRAM write precharge delay time. In F						
		auto-precharge mode, they specify the time until the next bank active						
		command is issued after a write cycle. After a write cycle, the next active						
		command is not issued for a period of TRWL + TPC.						
		TRWL	Description					
		00	1 cycle (Initial value)					
		01	2 cycles					
		10	3 cycles					
		11	4 cycles					
4:2	TRC	RAS Cycle Tim	e: For SDRAM, no bank active command is issued	RW				
		during the perio	d TRC after an auto-refresh command. In self-refresh,					
		these bits also s	specify the delay cycles to be inserted after CKE					
		assertion.						
		TRC	Description					
		000	1 cycle (Initial value)					
		001	3 cycle					
		010	5 cycle					
		011	7 cycle					
		100	9 cycle					
		101	11 cycle					
		110	13 cycle					
		111	15 cycle					
1:0	TCL	CAS Latency:	Specify the delay from read command to data becomes	RW				
		available at the	outputs.					
		TCL	Description					
		00	Inhibit (Initial value)					
		01	2 cycles					
		10	3 cycles					
		11	Inhibit					

3.6.1.2 SDRAM Mode Register (SDMR)

SDMR is written to via the SDRAM address bus and is a 15-bit write-only register. It sets SDRAM mode for SDRAM bank. SDMR is undefined after a reset.

Write to the SDRAM mode register use the address bus rather than the data bus. If the value to be set is X and the SDMR address is Y, the value X is written in the SDRAM mode register by writing in address X + Y. Here Y is 0x8000, X is value for SDRAM configuration. For example X is 0x0022, random data is written to the address offset 0x8022, as a result, 0x0022 is written to the SDMR register. The range for value X is 0x0000 to 0x7FFF.

The Mode Register is used to define the specific mode of operation of the SDRAM. This definition includes the section of a burst length, a burst type, a CAS latency, an operating mode and a write burst mode, as shown in following figure.

For Mobile SDR, Extended Mode Register is used to define low power mode.

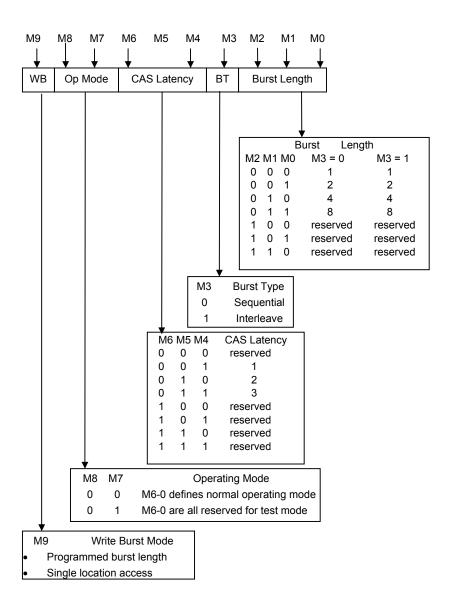

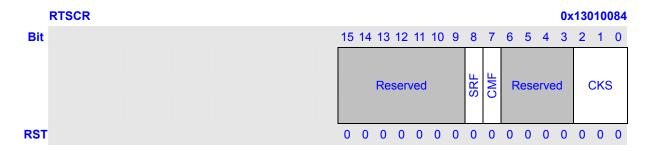

Figure 3-17 Synchronous DRAM Mode Register Configuration

3.6.1.3 Refresh Timer Control/Status Register (RTCSR)

RTCSR is a 16-bit readable/writable register that specifies the refresh cycle and the status of RTCNT.

RTCSR is initialized to 0x0000 by a reset.

Bits	Name		Description	RW					
15:9	Reserved	These bits always	read 0. Data written to these bits are ignored	R					
8	SRF	Self-refresh Flag	(SRF): Status flag that indicates EMC already enter	RW					
		self-refresh seque	self-refresh sequence						
		SRF Des	cription						
		1) No self-r	No self-refresh (Initial value)						
		Clea	ar condition: When 0 is written, write 1 is ignored						
		2) EMC alre	eady enter self-refresh sequence						
		Set	condition: when EMC enter self-refresh						
7	CMF	Compare-Match	Flag (CMF): Status flag that indicates a match between	RW					
		the refresh timer of	e refresh timer counter (RTCNT) and refresh time constant register						
		(RTCOR) values.	Writes to 1 of this bit have no effect.						
		CMF	Description						
		0	RTCNT and RTCOR values do not match (Initial value)						
			Clear condition: When 0 is written						
		1	RTCNT and RTCOR values match						
			Set condition: When RTCNT = RTCOR						
2:0	CKS	Refresh Clock S	elect Bits: These bits select the clock input to RTCNT.	RW					
		The source clock	is the external bus clock (CKO). The RTCNT count						
		clock is CKO divid	ded by the specified ratio.						
		CKS	Description						
		000	Disable clock input (Initial value)						
		001	Bus lock CKO/4						
		010	CKO/16						
		011	CKO/64						
		100	CKO/256						
		101	CKO/1024						

	110	CKO/2048	
	111	CKO/4096	

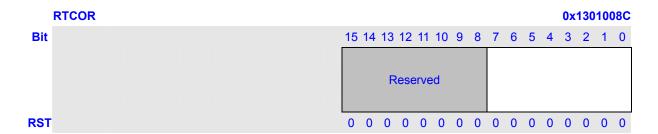

3.6.1.4 Refresh Timer Counter (RTCNT)

RTCNT is a 16-bit read/write register. RTCNT is a 16-bit counter that counts up with input clocks. The clock select bits (CKS2–CKS0) of RTCSR select the input clock. When the refresh bit (RFSH) of the memory control register (DMCR) is set to 1 and the refresh mode is set to auto-refresh, a memory refresh cycle starts when RTCNT matches RTCOR. RTCNT is initialized to 0x0000 by a reset.

3.6.2 Refresh Time Constant Register (RTCOR)

RTCOR is a 16-bit read/write register. The values of RTCOR and RTCNT (bottom 8 bits) are constantly compared. When the refresh bit (RFSH) of the memory control register (DMCR) is set to 1 and the refresh mode bit (RMODE) is set to auto-refresh, a memory refresh cycle starts when RTCNT matches RTCOR. RTCOR is initialized to 0x0000 by a reset.

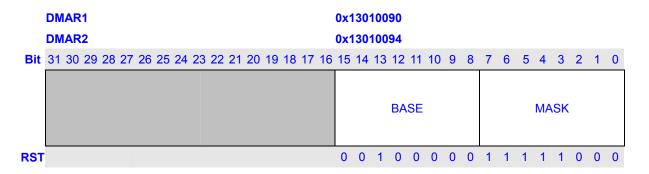

3.6.2.1 DRAM Bank Address Configuration Register (DMARn, n = 1, 2)

DMARn define the physical address for SDRAM bank0 or bank 1, respectively. Each register contains a base address and a mask. When the following equation is met:

(physical_address [31:24] & MASK_n) == BASE_n

The bank n is active. The *physical_address* is address output on internal system bus. DRAM bank regions must be programmed so that each bank occupies a unique area of the physical address space. Programming overlapping bank regions will result in unpredictable error.

These registers are initialized by a reset.

Bits	Name	Description	RW
31:16	Reserved	Writes to these bits have no effect and read always as 0.	R
15:8	BASEn	Address Base: Defines the base address of SDRAM Bank. The initial	RW
		values are:	
		DMAR.BASE1 0x20	
		DMAR.BASE2 0x28	
23:20	MASKn	Address Mask: Defines the mask of SDRAM Bank.	RW
		The initial values are:	
		DMAR.MASK 0xF8	

3.6.3 Example of Connection

Following figure shows an example of connection of 512K x 16-bit x 2-bank SDRAM.

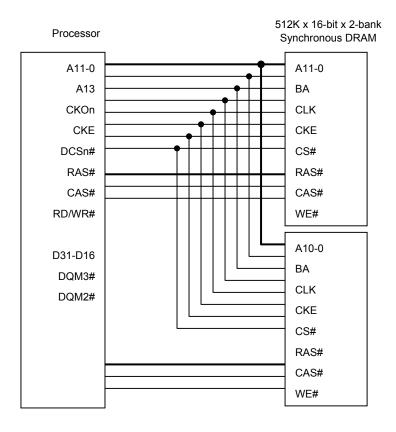

Figure 3-18 Example of Synchronous DRAM Chip Connection (1)

Following figure shows an example of connection of 1M x 16-bit x 4-bank synchronous DRAM.

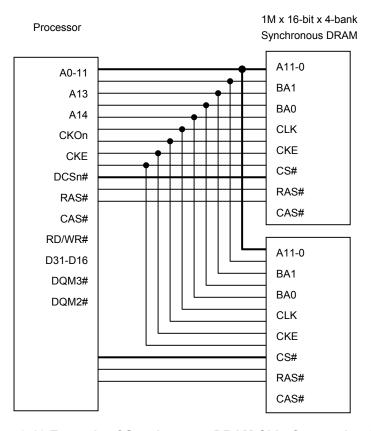

Figure 3-19 Example of Synchronous DRAM Chip Connection (2)

3.6.4 Address Multiplexing

SDRAM can be connected without external multiplexing circuitry in accordance the address multiplex specification bits CA2~0, RA1~0 and BA in DMCR. Table 3-7 shows the relationship between the address multiplex specification bits and the bits output at the address pins.

A14-0 is used as SDRAM address. The original values are always output at these pins.

Table 3-7 SDRAM Address Multiplexing (32-bit data width) *4

Row A14-A26			Row	A14-A26			

Notes:

- 1) L/H is a bit used in the command specification; it is fixed at L or H according to the Access mode.
- 2) Bank address specification
- 3) If one bank select signal is used (BA = 0), take A13 as bank select signal. If two bank select signals are used (BA = 1), take A13 and A14 as bank select signals
- 4) The A0 to A14 in table head are output pins. The A2 to A28 in table body are physical address.

3.6.5 SDRAM Command

Commands for SDRAM are specified by RAS#, CAS#, RD/WR and special address signals. The processor accesses SDRAM by using the following subset of standard interface commands.

- 1. Mode Register Set (MRS)
- 2. Bank Activate (ACTV)
- 3. Read (READ)
- 4. Write (WRIT)
- 5. Burst Terminate
- 6. Precharge All Banks (PALL)
- 7. Auto-Refresh (CBR)
- 8. Enter Self-Refresh (SLFRSH)
- 9. No Operation (NOP)

Table 3-8 SDRAM Command Encoding (Notes: 1)

Command		Processor Pins						
	CS#	RAS#	CAS#	RD/WR#	DQM	A14-11, A9-0	A10	Note
INHIBIT	Н	Х	Х	Х	Х	Х	Х	
NOP	L	Н	Н	Н	Х	Х	Х	
MRS	L	L	L	L	Х	Op-Code		
ACTV	L	L	Н	Н	Х	Bank, Row	Х	2
READ	L	Н	L	Н	L/H	Bank, Col	L	3
WRIT	L	Н	L	L	L/H	Bank, Col	L	3
Burst Terminate	L	Н	Н	L	Х	Х	Х	
PRE	L	L	Н	L	Х	Bank	L	
PALL	L	L	Н	L	Х	Х	Н	
CBR/SLFRSH	L	L	L	Н	Х	Х	Х	4

Note:

- CKE is HIGH for all commands shown except SLFRSH
- A0-A12 provides row address, and A13-A14 determines which bank is active.
- A0-A9 provides column address, and A13-A14 determines which bank is being read from or written to.
- This command is CBR if CKE is HIGH, SLFRSH if CKE is LOW.

3.6.6 SDRAM Timing

The SDRAM bank function is used to support high-speed accesses to the same row address. As SDRAM is internally divided into two or four banks, it is possible to activate one row address in each bank.

When a de-active bank is accessed, an access is performed by issuing an ACTV command following by READ or WRIT command.

When an active bank is accessed and just hit the open row, an access is performed by issuing READ or WRIT command immediately without issuing an ACTV command.

When an active bank is accessed but hit a closed row, a PRE command is first issued to precharge the bank, then the access is performed by issuing an ACTV command followed by a READ or WRIT command.

There is a limit on Tras, the time for placing each bank in the active state. If there is no guarantee that there will not be a cache hit and another row address will be accessed within the period in which this value is maintained by program execution, it is necessary to set auto-refresh and set the refresh cycle to no more than the maximum value of Tras. In this way, it is possible to observe the restrictions on the maximum active state time for each bank. If auto-refresh is not used, measures must be taken in the program to ensure that the banks do not remain active for longer than the prescribed time.

Glossary

Tr - row active cycle

Trw - row active wait cycle

Trwl - write latency cycle

Tpc - precharge cycle

TRr - refresh command cycle

Trc - RAS cycle

Trs1 - self refresh cycle 1

Trs2-self refresh cycle 2

Trs3 – self refresh cycle 3

Trsw – self refresh wait cycle

Tc1 - command cycle 1

Tc2 - command cycle 2

Tc3 - command cycle 3

Tc4 - command cycle 4

Tc5 - command cycle 5

Tc6 - command cycle 6

Tc7 – command cycle 7

Tc8 - command cycle 8

Td1 - data cycle 1

Td2 – data cycle 2

Td3 - data cycle 3

Td4 - data cycle 4

Td5 – data cycle 5

Td6 - data cycle 6

Td7 - data cycle 7

Td8 – data cycle 8

TRp1 – precharge-all cycle 1

TRp2 – precharge-all cycle 2

TRp3 – precharge-all cycle 3

TRp4 – precharge-all cycle 4

TMw1 - mode register set cycle 1

TMw2 – mode register set cycle 2

TMw3 – mode register set cycle 3

TMw4 - mode register set cycle 4

Following figures show the timing of 4-beat burst access, 8-beat burst access and single access.

Figure 3-31 Synchronous DRAM Single Write Timing (Same Row)

3.6.7 Power-Down Mode

The SDRAM power-down mode is supported to minimize the power consumption. CKE going to low level when SDRAM is idle/active state will drive SDRAM to precharge/active power-down mode. The clock supplies to SDRAM may be stopped also when CKE keep in low level more than two cycles. When a new access start or a refresh request, CKE is driven to high level and clock supplies is re-enabled. In power-down mode, clock of the accessed SDRAM bank pair is supplied. Clock of the other pair is stopped.

Following figures shows the timing of power-down mode and clock stopping.

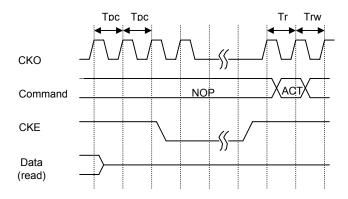

Figure 3-32 SDRAM Power-Down Mode Timing (CKO Stopped)

Following figure shows the power-down mode timing that CKE low level less than two cycles and clock is not stopped.

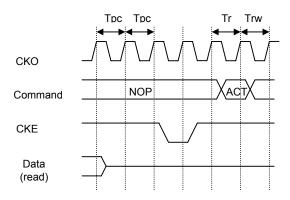

Figure 3-33 SDRAM Power-Down Mode Timing (Clock Supplied)

3.6.8 Refreshing

EMC provide a function for controlling the refresh of synchronous DRAM, Auto-refresh can be performed by clearing the RMODE bit to 0 and setting the RFSH bit to 1 in DMCR. If SDRAM is not accessed for a long period, self-refresh mode can be activated by set both the RMODE bit and the RFSH bit to 1.

3.6.8.1 AUTO-Refresh

Refreshing is performed at intervals determined by the input clock selected by bits CKS2-0 in RTCSR, and the value set in RTCOR. The value of bits CKS2-0 in RTCSR should be set so as to satisfy the refresh interval stipulation for the synchronous DRAM used. First make the settings for RTCOR, RTCNT, and the RMODE and RFSH bits in MCR, and then make the CKS2-CKS0 setting. When the clock is selected by CKS2-CKS0, RTCNT starts counting up from the value at that time. The RTCNT value is constantly compared with the RTCOR value, and if the two values are the same, a refresh request is generated and an auto-refresh is performed. At the same time, RTCNT is cleared to zero and the count-up is restarted. Figure 3-34 shows the auto-refresh cycle operation.

First, a REF command is issued in the TRr cycle. After the TRr cycle, new command output cannot be performed for the duration of the number of cycles specified by the TRC bits in DMCR. The TRC bits must be set so as to satisfy the synchronous DRAM refresh cycle time stipulation (active/active command delay time). Following figure shows the auto-refresh timing when TRC is set to 2.

Auto-refresh is performed in normal operation and sleep mode.

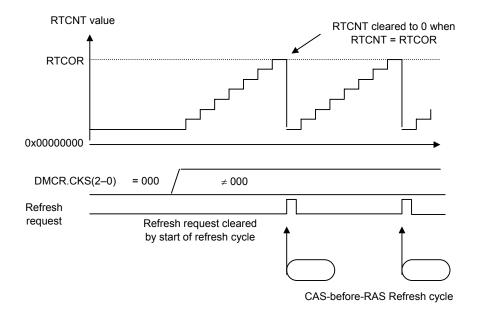

Figure 3-34 Synchronous DRAM Auto-Refresh Operation

A PALL command is issues firstly to precharge all banks. Then a REF command is issued in the TRr cycle.

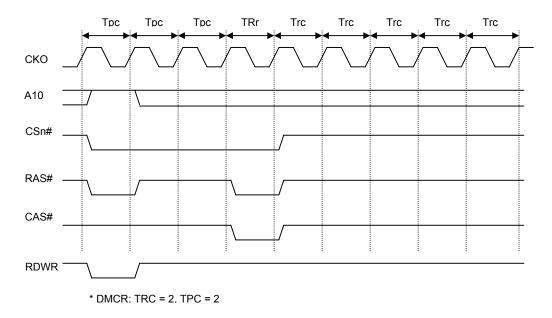

Figure 3-35 Synchronous DRAM Auto-Refresh Timing

3.6.8.2 SELF-Refresh

Self-refresh mode is a kind of sleep mode in which the refresh timing and refresh addresses are generated within the SDRAM. Self-refreshing is activated by setting both the RMODE bit and the RFSH bit to 1. The self-refresh state is maintained while the CKE signal is low. SDRAM cannot be accessed while in the self-refresh state. Self-refresh mode is cleared by clearing the RMODE bit to 0. After self-refresh mode has been cleared, command issuance is disabled for the number of cycles specified by the TRC bits in DMCR. Trsw cycles are inserted to meet the minimum CKE negation time specified by the TRAS bits in DMCR. Self-refresh timing is shown in following figure. Settings must be made so that self-refresh clearing and data retention are performed correctly, and auto-refresh is performed at the correct intervals. When self-refreshing is activated from the state in which auto-refreshing is set, or when exiting sleep mode other than through a reset, auto-refreshing is restarted if RFSH is set to 1 and RMODE is cleared to 0 when self-refresh mode is cleared. If the transition from clearing of self-refresh mode to the start of auto-refresh takes time, this time should be taken into consideration when setting the initial value of RTCNT. Making the RTCNT value 1 less than the RTCOR value will enable refreshing to be started immediately. After self-refreshing has been set, the self-refresh state continues even if the chip standby state is entered using the processor's sleep function, and is maintained even after recovery from sleep mode other than through a reset. In the case of a reset, the bus state controller's registers are initialized, and therefore the self-refresh state is cleared.

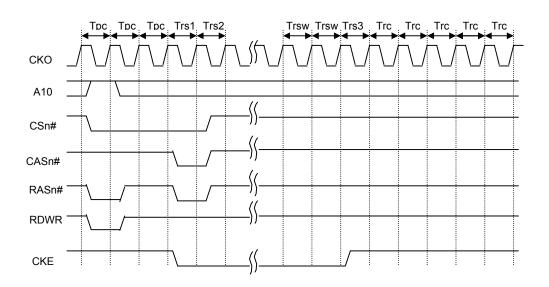

Self-refreshing is performed in normal operation, in idle mode and in sleep mode. In sleep mode, if RFSH bit in DMCR is 1, self-refresh is always performed in spite of RMODE field in DMCR until sleep mode is canceled.

Relationship between Refresh Requests and Bus Cycle Requests:

If a refresh request is generated during execution of a bus cycle, execution of the refresh is deferred until the bus cycle is completed. If a match between RTCNT and RTCOR occurs while a refresh is waiting to be executed, so that a new Refresh request is generated, the previous refresh request is eliminated. In order for refreshing to be performed normally, care must be taken to ensure that no bus cycle is longer than the refresh interval.

A PALL command is issued firstly to precharge all banks.

* DMCR: TRAS = 0. TRC = 2

Figure 3-36 Synchronous DRAM Self-Refresh Timing

3.6.9 Initialize Sequence

In order to use SDRAM, mode setting must first be performed after powering on. To perform SDRAM initialization correctly, the EMC registers must first be set, followed by a write to the SDRAM mode register.

In SDRAM mode register setting, the address signal value at that time is latched by MRS command. If the value to be set is X, the bus state controller provides for value X to be written to the synchronous DRAM mode register by performing a write to address offset 0x8000 + X for bank 0. In this operation the data is ignored, but the mode write is performed as a byte-size access. To set burst read/write, CAS latency 2 to 3, wrap type = sequential, and burst length 4 supported by the processor, arbitrary data is written in a byte-size access to the following addresses.

Table 3-9 SDRAM Mode Register Setting Address Example (32-bit)

	Bank 0	Bank 1	
CAS latency 2	8022	8022	
CAS latency 3	8032	8032	

Table 3-10 SDRAM Mode Register Setting Address Example (16-bit)

	Bank 0	Bank 1	
CAS latency 2	8011	8011	
CAS latency 3	8019	8011	

The value set in DMCR.MRSET is used to select whether a Pre-charge All Banks command (PALL) or a Mode Register Set command (MRS) is issued. DMCR.MBSEL is used to select Bank 0 or Bank 1 for Mode Register Set. The timing for the Pre-charge All Banks command is shown in Figure 3-37, and the timing for the Mode Register Set command in Figure 3-38

Before mode register setting, a 200 μ s idle time (depending on the memory manufacturer) must be guaranteed after powering on requested by the synchronous DRAM. If the reset signal pulse width is greater than this idle time, there is no problem in performing initialize sequence immediately.

First, a pre-CHARGE all bank (PALL) command must be issued by performing a write to address offset 0x8000 + X for bank 0, while DMCR.MRSET = 0, DMCR.MBSEL = 0.

Next the NUMBER of dummy auto-refresh cycles specified by the manufacturer (usually 8) or more must be executed. This is usually achieved automatically while various kinds of initialization are being performed after auto-refresh setting, but a way of carrying this out more dependably is to set a short refresh request generation interval just while these dummy cycles are being executed. With simple read or write access, the address counter in the synchronous DRAM used for auto-refreshing is not initialized, and so the cycle must always be an auto-refresh cycle.

0

0

After auto-REFRESH has been executed at least the prescribed number of times, a Mode Register Set command (MRS) is issued in the TMw1 cycle by setting DMCR.MRSET to 1 and DMCR.MBSEL to 0 for bank 0 or DMCR.MBSEL to 1 for bank 1 and performing a write to address offset 0x8000 + X.

An example of SDRAM operation flow is as the following:

Disable Bus release

Write 0x00000000 to BCR

o Initialize RTCOR and RTCNT for auto-refresh cycle

Before configure SDRAM SDMR, SDRAM needs to execute auto-refresh, the number of times depends on the type of SDRAM. It's better to set a short refresh request generation interval here. For example, set RTCOR to 0x0000000F, and set RTCNT 0x00000000.

Initialize DMCR for Precharge all bank and auto-refresh

When DMCR.RMODE=0 and DMCR.RFSH=1, enter auto-refresh mode;

When DMCR.MRSET=0, DMCR.MBSEL=0 (bank 0) or 1 (bank 1), write SDMR whill generates Precharge all bank cycle.

DMCR.TPC must be defined for precharge.

Disable refresh counter clock

Write 0x00000000 to RTCSR

Execute Precharge all bank before auto-refresh

Because DMCR.MRSET=0, DMCR.MBSEL=0 (bank 0) or 1 (bank 1), writing SDMR generates a Precharge all bank cycle, for example, write address (0x13018000).

Enable fast refresh counter clock for auto-refresh cycle

For example, write 0x00000001 to RTCSR

Wait for number of auto-refresh cycles (defined by SDRAM chip)

When RTCSR.CMF=1, it indicates value of RTCOR and RTCNT match and an auto-refresh cycle occurs.

Configure DMCR for SDRAM MODE Register Set

When DMCR.MRSET=1, DMCR.MBSEL=0 (bank 0) or 1 (bank 1), write SDMR generate MRSET cycle.

For example, write 0x059A5231 to DMCR, so that:

Bus-width: 32-bit; Column Address: 9-bit; Row Address: 12-bit; Auto-refresh mode; SDMR Set mode; 4-bank; etc..

SDRAM Mode Register Set

Because DMCR.MRSET=1 and DMCR.MBSEL=0, for example, write address 0x13018022 to configure SDMR as:

Burst Length: 4 burst Burst Type: Sequential

CAS Latency: 2

0

Set normal auto-refresh counter clock

For example, write 0x00000005 to RTCSR

o Then Read/Write SDRAM can be executed

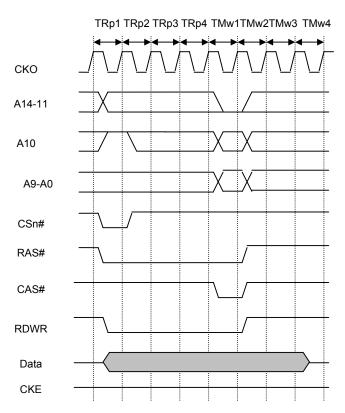

Figure 3-37 SDRAM Mode Register Write Timing 1 (Pre-charge All Banks)

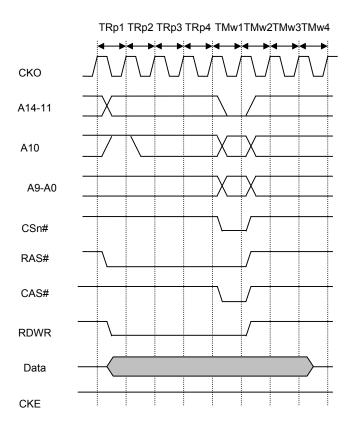

Figure 3-38 SDRAM Mode Register Write Timing 2 (Mode Register Set)

3.7 Bus Control Register (BCR)

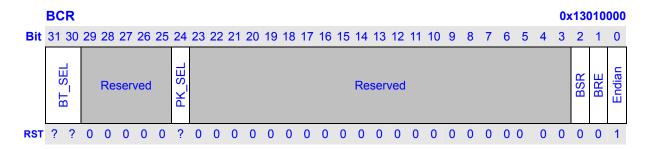

BCR is used to specify the behavior of EMC on system bus and indicate the BOOT_SEL[1:0] status which defines the boot configure. It is initialized to 0x00000001 by any reset.

BOOT_SEL[1:0] pins define the boot time configurations as listed in the following table.

Table 3-11 Boot Configuration

Boot_sel[1]	Boot_sel[0]	Description
0	0	Boot from NOR flash or SPI (SPI0/CE0)
0	1	Boot from NAND flash: 512/2k/4k page size
1	0	Boot from SD card: MSC0
1	1	Boot from USB device

Name	Description	RW	Reset Value	Address	Access Width
BCR	Bus Control Register	RW	0x?0000001	0x13010000	32

Bits	Name	Description	RW
31:30	BT_SEL	BOOT_SEL (BT_SEL[1:0]): Status of BOOT_SEL pins that indicate the	R
		boot configure. See the above boot configuration table.	
29:25	Reserved	Writes to these bits has no effect and always read as 0.	R
24	PK_SEL	PKG Select:	R
		0, 32/16-bit data normal order; 1, 16-bit data special order	
23:3	Reserved	Writes to these bits has no effect and always read as 0.	R
2	BSR	Bus Share Select:	RW
		0, Nand and SDRAM bus share; 1, Nand and SDRAM bus separate	
1	BRE	Bus Release Enable: When clear, once a transaction to EMC begins on	RW
		the system bus; it must be completed before another transaction starts.	
		When set, the system bus may be released to allow other transaction	
		before EMC prepare the read data or be able to receipt the write data. If	
		slow memory devices are used in the system, setting this bit will improve	
		the efficiency of the whole system. The efficiency of SDRAM access may	
		be improved by setting this bit. But the power consumption is increased if	

		this bit is set.			
		BRE Description			
		The system bus can not be released during an access (Initial value)			
		2. The system bus can be released during an access			
0	Endian	Endian: Indicates the system is little-endian.	R		

4 BCH Controller

4.1 Overview

The BCH Controller implements data ECC encoding and decoding.

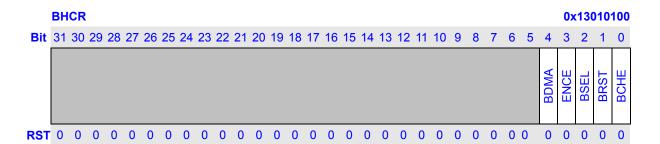

4.2 Register Description

Table 4-1 BCH Registers

Name	Description	RW	Reset Value	Address	Access Width
BHCR	BCH Control register	R	0x00000000	0x130D0000	32

4.2.1 BCH Control Register (BHCR)

BHCR is a 32-bit read/write register that is used to configure BCH controller. It is initialized by any reset.

Bits	Name	Description		RW	
31:5	Reserved	Writes to the	se bits have no effect and read always as 0.	R	
4	BDMA	BCH DMA E	nable: It is used to enable or disable dma transfer during	RW	
		correction.	correction.		
		BDMA	Description		
		0	DMA transfer is disabled (Initial value)		
		1	DMA transfer is enabled		
3	ENCE	BCH Encodi	ng/Decoding Select: It is used to define whether in	RW	
		encoding or i	n decoding phase when BCH is used.		
		ENCE	Description		
		0	Decoding (Initial value)		

		1	Encoding			
2	BSEL	4/8 Bit BCH	Select: It is used to select the correction algorithm between	RW		
		4-bit and 8-bi	t BCH.			
		BSE	Description			
		0	4-bit correction (Initial value)			
		1	8-bit correction			
1	BRST	BCH Reset:	It is used to reset BCH controller. This bit is cleared	W		
		automatically	automatically by hardware and always read as 0.			
		BRST	Description			
		0	BCH controller is not reset (Initial value)			
		1	BCH controller is reset			
0	BCHE	BCH Enable	: BCH correction is enable/disable.	RW		
		BCHE	Description			
		BCH is disabled (initial value)				
		BCH is 6	enabled			

4.2.2 BCH Control Set Register (BHCSR)

BHCSR is a 32-bit write-only register that is used to set BCH controller to 1.

When write 1 to BHCSR, the corresponding bit in BHCR register is set to 1. Write 0 to BHCSR is ignored.

Bits	Name	Description	RW
31:5	Reserved	Writes to these bits have no effect and read always as 0.	R
4	BDMAS	BCH DMA Enable Set: It is used to set BHCR.BDMA to 1.	W
3	ENCES	BCH Encoding/Decoding Select Set: It is used to set BHCR.ENCE to	W
		1.	
2	BSELS	4/8 Bit BCH Select Set: It is used to set BHCR.BSEL to 1	W
1	BRSTS	BCH Reset Set: It is used to set BHCR.BRST to 1.	W
0	BCHES	BCH Enable Set: It is used to set BHCR.BCHE to 1.	W

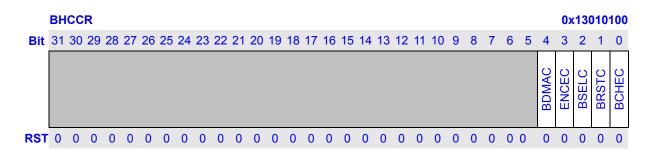

4.2.3 BCH Control Clear Register (BHCCR)

BHCCR is a 32-bit write-only register that is used to clear BCH controller to 0.

When write 1 to BHCCR, the corresponding bit in BHCR register is cleared to 0. Write 0 to BHCCR

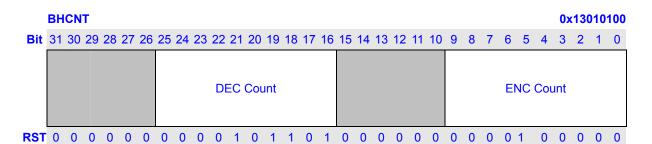

is ignored.

Bits	Name	Description	RW
31:5	Reserved	Writes to these bits have no effect and read always as 0.	R
4	BDMAC	BCH DMA Enable Clear: It is used to clear BHCR.BDMA to 0.	W
3	ENCEC	BCH Encoding/Decoding Select Clear: It is used to clear BHCR.ENCE	W
		to 0.	
2	BSELC	4/8 Bit BCH Select Clear: It is used to clear BHCR.BSEL to 0	W
1	Reserved	Writes to this bit have no effect and read always as 0.	R
0	BCHEC	BCH Enable Clear: It is used to clear BHCR.BCHE to 0.	W

4.2.4 BCH ENC/DEC Count Register (BHCNT)

BCHCNT is a 32-bit read/write register that is used to indicate the total number of bytes during encoding or decoding. It is initialized by any reset.

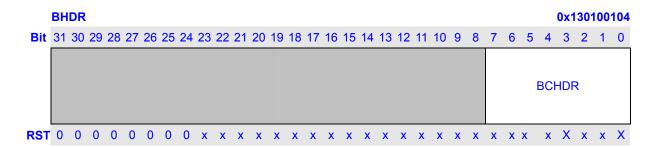

Bits	Name	Description	RW
31:26	Reserved	Writes to these bits have no effect and read always as 0.	R
25:16	DEC Count	DEC Count : It is used to indicate total byte count in BCH decoding	RW
		which includes data bytes + parity bytes.	
15:10	Reserved	Writes to these bits have no effect and read always as 0.	R
9:0	ENC Count	ENC Count: It is used to indicate total byte count in BCH encoding	RW
		which just includes data bytes and should be less and equal to 1010	
		bytes when 8-bit BCH is selected and 1016 bytes when 4-bit BCH is	
		selected.	

4.2.5 BCH Data Register (BHDR)

BHDR is an 8-bit write-only register that is used to transfer ecc data to BCH.

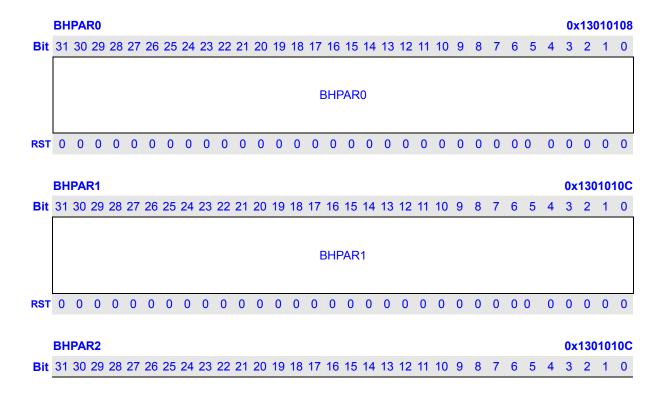

4.2.6 BH Parity Register (BHPARn, n=0,1,2,3)

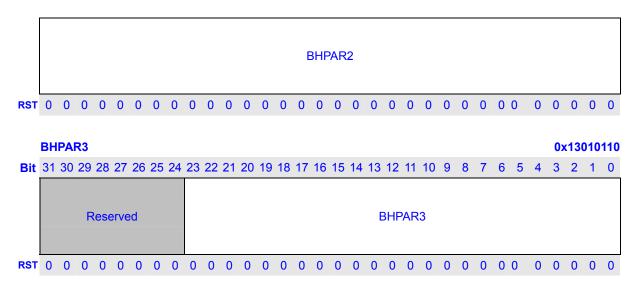

BHPAR0, BHPAR1, BHPAR2 and BHPAR3 are all 32-bit read/write register that contains the encoding parity data during BCH correction. It is initialized by any reset and BRST of BHCR.

When 8-bit BCH is selected, the four parity register, BHPAR0, BHPAR1, BHPAR2 and BHPAR3 together consist of the 104 bits of parity data and bit 0 of BHPAR0 is the 104th bit of parity data and bit 7 of BHPAR3 is the 1st bit of parity data.

Similarly, when 4-bit BCH is selected, the two parity register, BHPAR0 and BHPAR1 together consist of the 52 bits of parity data and bit 0 of BHPAR0 is the 52th bit of parity data and bit 19 of BHPAR1 is the 1st bit of parity data.

4.2.7 BCH Interrupt Status Register (BHINT)

BHINT is a 32-bit read-only register that contains the interrupt flag and error count information during BCH correction. It is initialized by any reset. Software write 1 to clear the corresponding bit except ERRC.

	вн	INT	•																										0x	130)10 ⁻	114
Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

1	UNCOR	Uncorrection Error: It indicates that hardware finish BCH encoding.	R
		UNCOR Description	
		(1) No uncorrectable error (Initial value)	
	EDD	(2) Uncorrectable error occur	_
0	ERR	Error: It indicates that hardware detects error bits in data in the data block	R
		during BCH decoding.	
		ERR Description	
		1. No error (Initial value)	
		2. Error occur	

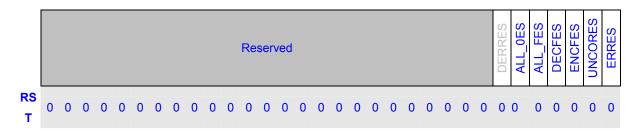

4.2.8 BCH Interrupt Enable Set Register (BHINTES)

BHINTES is a 32-bit write-only register that is used to set BHINTE register. Writing 1 to BHINTES will set the corresponding bit in BHINTE to 1. Writing 0 to BHINTES is ignored.

BHINTES 0x13010118

Bit 31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0

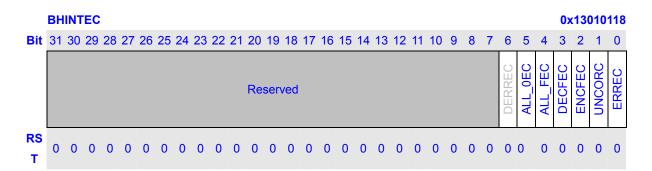

Bits	Name	Description	RW
31:7	Reserved	Writes to these bits have no effect and read always as 0.	R
6	DERRES	DMA Error Interrupt Enable Set: It is used to set BHINTE.DERRE to	$\bigvee\bigvee$
		1.	
5	ALL_0ES	ALL_0 Interrupt Enable Set: It is used to set BHINTE.ALL_0E to 1.	W
4	ALL_FES	ALL_F Interrupt Enable Set: It is used to set BHINTE.ALL_FE to 1.	W
3	DECFES	Decoding Finish Interrupt Enable Set: It is used to set	W
		BHINTE.DECFE to 1.	
2	ENCFES	Encoding Finish Interrupt Enable Set: It is used to set	W
		BHINTE.ENCFE to 1.	
1	UNCORES	Uncorrection Error Interrupt Enable Set: It is used to set	W
		BHINTE.ENCFE to 1.	
0	ERRES	Error Interrupt Enable Set: It is used to set BHINTE.ERRE to 1.	W

4.2.9 BCH Interrupt Enable Clear Register (BHINTEC)

BHINTEC is a 32-bit write-only register that is used to clear BHINTE register. Writing 1 to BHINTEC will clear the corresponding bit in BHINTE to 0. Writing 0 to BHINTEC is ignored.

Bits	Name	Description	RW
31:7	Reserved	Writes to these bits have no effect and read always as 0.	R
6	DERREC	DMA Error Interrupt Enable Clear: It is used to clear BHINTE.DERRE	$\vee\vee$
		to 0.	
5	ALL_0EC	ALL_0 Interrupt Enable Clear: It is used to clear BHINTE.ALL_0E to	W
		0.	
4	ALL_FEC	ALL_F Interrupt Enable Clear: It is used to clear BHINTE.ALL_FE to	W
		0.	

3	DECFEC	Decoding Finish Interrupt Enable Clear: It is used to clear	W
		BHINTE.DECFE to 0.	
2	ENCFEC	Encoding Finish Interrupt Enable Clear: It is used to clear	W
		BHINTE.ENCFE to 0.	
1	UNCOREC	Uncorrection Error Interrupt Enable Clear: It is used to clear	W
		BHINTE.ENCFE to 0.	
0	ERREC	Error Interrupt Enable Clear: It is used to set BHINTE.ERRE to 0.	W

4.2.10 BCH Interrupt Enable Register (BCHINTE)

BCHINTE is a 32-bit read/write register that is used to enable/disable interrupts during BCH correction. It is initialized by any reset.

	вс	HIN	ITE																										0x	130	10	118
Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
												Res	ser	/ed												DERRE	ALL_0E	ALL_FE	DECFE	ENCFE	UNCORE	ERRE
RS T	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bits	Name	Description	RW
31:7	Reserved	Writes to these bits have no effect and read always as 0.	R
6	DERRE	DMA Error Interrupt Enable: It is used to enable or disable dma	RW
		transfer error interrupt.	
		DERRE Description	
		0 Disable DMA error interrupt (Initial value)	
		1 Enable DMA error interrupt	
5	ALL_0E	ALL_0 Interrupt Enable: It is used to enable or disable all_0 data	RW
		interrupt.	
		ALL_0E Description	
		0 Disable ALL_0 data interrupt (Initial value)	
		1 Enable ALL_0 data interrupt	
4	ALL_FE	ALL_F Interrupt Enable: It is used enable or disable all_f data	RW
		interrupt.	
		ALL_FE Description	
		0 Disable ALL_F data interrupt (Initial value)	
		1 Enable ALL_F data interrupt	
3	DECFE	Decoding Finish Interrupt Enable: It is used to enable or disable	RW
		decoding finish interrupt.	
		DECFE Description	
		0 Disable Decoding Finish Interrupt (Initial value)	

		1 Enable Decoding Finish Interrupt	
2	ENCFE	Encoding Finish Interrupt Enable: It is used to enable or disable	RW
		encoding finish interrupt.	
		ENCFE Description	
		Disable Encoding Finish Interrupt (Initial value)	
		1 Enable Encoding Finish Interrupt	
1	UNCORE	Uncorrection Error Interrupt Enable: It is used to enable or disable	RW
		uncorrection error interrupt.	
		UNCORE Description	
		Disable Uncorrectable Error interrupt (Initial value)	
		Enable Uncorrectable Error Interrupt	
0	ERRE	Error Interrupt Enable: It is used to enable or disable error interrupt.	RW
		ERRE Description	
		Disable Error interrupt (Initial value)	
		2. Enable Error interrupt	

4.2.11 BCH Error Report Register (BCHERRn, n=0,1,2,3)

BCHERRn is 32-bit read/write register that contains the index for each error after BCH decoding. It is initialized by any reset and BRST of BCHCR.

BCHERR0 contains INDEX0 and INDEX1.

BCHERR1 contains INDEX2 and INDEX3.

BCHERR2 contains INDEX4 and INDEX5.

BCHERR3 contains INDEX6 and INDEX7.

	BCHI BCHI BCHI	ERR	1																									0x	130)10 ⁻	11C 120 124
	31 3			27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4				1 28 0
	Reserved					IN	IDE	Xn	(n=	1,3,	5,7)					Reserved					IN	NDE	EXn	(n=	0,2,	4,6)			
RST	0 0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bits	Name	Description	RW
31:29	Reserved	Writes to these bits have no effect and read always as 0.	R
28:16	INDEXn	Error Bit Index: It is used to indicate the location of the error bit. For	R
		example, INDEX=2, it means the second bit is an error bit.	
15:13	Reserved	Writes to these bits have no effect and read always as 0.	R

12:0	INDEXn	Error Bit Index: It is used to indicate the location of the error bit. For	R
		example, INDEX=1, it means the first bit is an error bit.	

4.3 BCH Operation

BCH controller uses BCH(n, k) codes. Here n is less and equal to 8191-bit and k is less and equal to 8087-bit in 8-bit correction and 8139-bit in 4-bit correction. During encoding, hardware will generate 104-bit parity data in 8-bit correction or 52-bit parity data in 4-bit correction. Parity data can be read out by cpu or dma. During decoding, if there are error bits in data block, after decoding BCHERRn registers will hold the error bit location that can be read by cpu or dma.

4.3.1 Endcoding Sequence

BCH encoding can be operated by cpu or dma.

4.3.1.1 CPU

- a) Set BCHCR.BCHE to 1 to enable BCH controller
- b) Select 4-bit or 8-bit correction by setting BCHCR.BSEL
- c) Set BCHCR.ENCE to 1 to enable encoding
- d) Set BCHCR.BRST to 1 to reset BCH controller
- e) Set BCHCNT.ENC_COUNT to data block size in bytes
- f) Byte-write all data block to BCHDR
- g) Check BCHINTS.ENCF bit or by enabling encoding finish interrupt
- h) When encoding finishes, read out the parity data in BCHPARn

4.3.1.2 DMA

- a) Set BCHCR.BCHE to 1 to enable BCH controller
- b) Select 4-bit or 8-bit correction by setting BCHCR.BSEL
- c) Set BCHCR.ENCE to 1 to enable encoding
- d) Set BCHCR.BRST to 1 to reset BCH controller
- e) Set BCHCNT.ENC_COUNT to data block size in bytes
- f) Set BCHCR.BDMA to 1 to select DMA transfer
- g) Start DMA transfer after configuring DMA channel
- h) DMA read data block from system memory and write to BCH controller automatically
- i) DMA will wait BCH encoding request when finishes writing data block
- j) BCH controller will issue encoding request to DMA when encoding ends
- k) DMA start to read out parity data
- I) After parity data is read out, BCH automatically reset itself and clear BCHINT.ENCF

Note: When DMA is enabled, software should guarantee not to enable encoding finish interrupt.

4.3.2 Decoding Sequence

BCH decoding can be operated by cpu or dma.

4.3.2.1 CPU

- a) Set BCHCR.BCHE to 1 to enable BCH controller
- b) Select 4-bit or 8-bit correction by setting BCHCR.BSEL
- c) Clear BCHCR.ENCE to 0 to enable decoding
- d) Set BCHCR.BRST to 1 to reset BCH controller
- e) Set BCHCNT.DEC_COUNT to data block size in bytes
- f) Byte-write all data block to BCHDR
- g) Check BCHINTS.DECF bit or by enabling decoding finish interrupt
- h) When decoding finishes, read out the status in BCHINT and error report in BCHERRn

4.3.2.2 Decoding Sequence

- a) Set BCHCR.BCHE to 1 to enable BCH controller
- b) Select 4-bit or 8-bit correction by setting BCHCR.BSEL
- c) Clear BCHCR.ENCE to 0 to enable decoding
- d) Set BCHCR.BRST to 1 to reset BCH controller
- e) Set BCHCNT.DEC_COUNT to data block size in bytes
- f) Set BCHCR.BDMA to 1 to select DMA transfer
- g) Start DMA transfer after configuring DMA channel
- h) DMA read data block from system memory and write to BCH controller automatically
- i) DMA will wait BCH decoding request when finishes writing data block
- j) BCH controller will issue decoding request to DMA when decoding ends
- k) DMA start to read out bch int status and error report data and write to memory
- If using descriptor DMA, if the data block needs error correction, the current data block syndrome generation and last data block error correction can be executed in pipeline automatically by DMA
- m) After status and error report data is read out, BCH automatically reset itself and clear BCHINT.DECF and Error status in BCHINT

Note: if the data block is all 0xf, BCH will set All f bit in BCHINT and doesn't do error correction.

5 DMA Controller

DMA controller (DMAC) is dedicated to transfer data between on-chip peripherals (MSC, AIC, UART, etc.), external memories, and memory-mapped external devices.

5.1 Features

- Support up to 8 independent DMA channels
- Two independent DMA core, each supports 4 channels
- Descriptor or No-Descriptor Transfer
- Transfer data units: byte, 2-byte (half word), 4-byte (word), 16-byte or 32-byte
- Transfer number of data unit: 1 ~ 2²⁴
- Independent source and target port width: 8-bit, 16-bit, 32-bit
- Two channel priority modes: fixed, round robin.

5.2 Register Descriptions

Table 5-1 DMAC Registers

Bits	Name	Description	RW
31:12	DBA	Descriptor Base Address	RW
11:4	DOA	Descriptor Offset Address	RW
3:0	Reserved	Write has no effect, read as zero	R

5.2.8 DMA Stride Address (DSDn, $n = 0 \sim 11$)

This register is ignored in No-Descriptor Transfer.

When address stride transfer is enabled in Descriptor mode, after a sub-block defined in DTCRn is finished transferring, the source or target stride address will be added up to the corresponding source or target address and the transfer will keep going until the transfer ends which means TC in DTCRn reach 0.

5.2.9 DMA Control

DMAC1 controls channel 0~5 and DMAC2 controls channel 6~11.

		1, Set the corresponding DCKEn bit to 1	

5.3 DMA manipulation

5.3.1 Descriptor Transfer

5.3.1.1 Normal Transfer

To do proper Descriptor DMA transfer, do as following steps:

- First of all, open channel clock by setting DCKEn register for corresponding channel
- 1 Check whether the status of DMA controller are available, that is, for global control (DMAC), ensure that DMAC.AR=0 and DMAC.HLT=0; while for expected channels, ensure that DCSn.AR=0, DCSn.HLT=0, DCSn.TT=0, DTCn=0 and DCSn.INV=0.
- 2 Select 4 word or 8 word descriptor by DCSn.DES8
- 3 For Descriptor transfer, guarantee DCSn.NDES=0
- 4 Initiate channel request register DRSRn
- Build descriptor in memory. Write the first descriptor address in DDAn and the address must be 16Bytes aligned in 4word descriptor and 32Bytes aligned in 8word descriptor. The descriptor address includes two parts: Base and Offset address. If the descriptor is linked, the 32-bit address of next descriptor is composed of 20-bit Base address in DDAn and 8-bit Offset address in DES3.DOA and the four LSB is 0x0. See Table 5-4 for the detailed 4-word descriptor structure.

Note: if stride address transfer is enabled, the address must be 32Bytes aligned because DES4 needs to read out.

- 6 Set 1 to the corresponding bit in DDR to initiate descriptor fetch
- 7 Set DMAC.DMAE=1 and expected DCSn.CTE=1 to launch DAM transfer
- 8 Hardware clears the corresponding bit in DDR as soon as it starts to fetch the descriptor.
- 9 If DES0.V =0 and DES0.VM=1, DMAC stops and set DCSn.INV=1. Otherwise, it waits for dma request from peripherals to start dma transfer
- After DMAC completes the current descriptor dma transfer, if DES0.VM=1, it clears DES0.V to 0 and writes back to memory. If DES0.Link=1, it sets DCSn.CT to 1, otherwise it sets DCSn.TT to 1. If the interrupt enabled, it will generates the corresponding interrupts.
- If DES0.LINK=1, after DMAC completes the current descriptor dma transfer and return to fetch the next descriptor and continues dma transfer until completes the descriptor dma transfer which DES0.LINK=0.
- When transfer end, clr DCSn.CTE to 0 to close the channel, and then clear DCSn.TT and DCSn.CT bits

Table 5-4 Descriptor Structure

Word	Bit	Name	Function

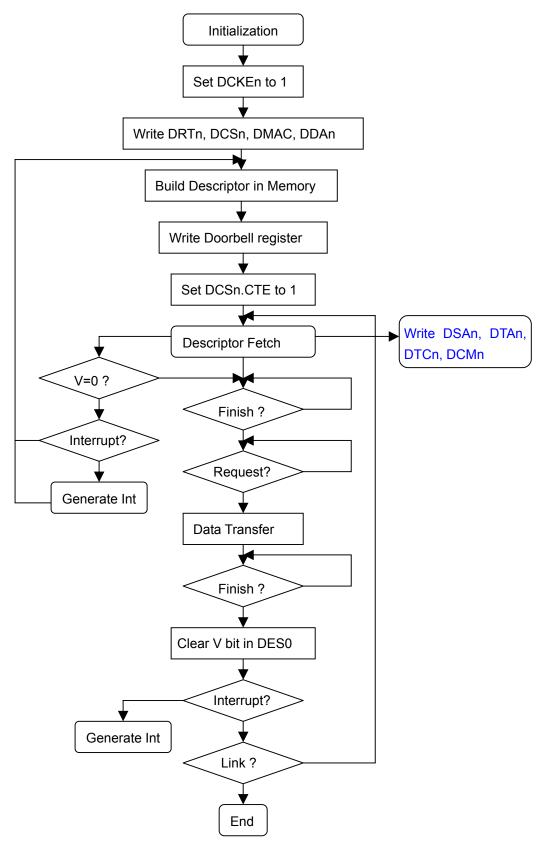

Figure 5-1 Descriptor Transfer Flow

5.3.1.2 Stride Address Transfer

During transfer, source or target address can be not continuous and the source and target stride offset address are showed in DSDn registers.

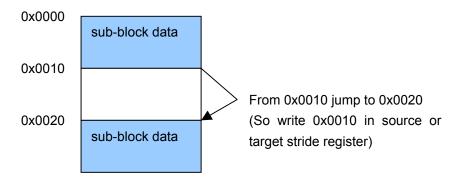

Figure 5-2 Example for Stride Address Transfer

5.3.1.3 BCH DMA Transfer

Channel 0 supports BCH DMA transfer.

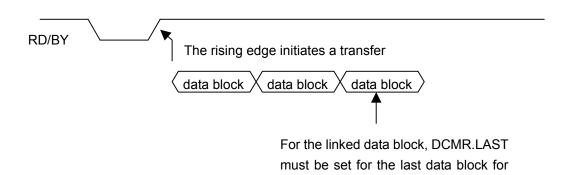

During BCH encoding, DMA read data from memory pointed by DSAR0 and write to BCH data register BHDR, after BCH encoding finishes, DMA write BHINT and BCH parity data BHPAR0~3 (8-bit BCH) or BHPAR0~1 (4-bit BCH) respectively to memory pointed by DTAR0, and then DMA clear BHINT and set BCH reset to BCH automatically.

During BCH decoding, DMA read data from memory pointed by DSAR0 and write to BCH data register BHDR, after BCH decoding finishes, if there is error in the data block, DMA will write BHINT, BHERR0~3 (8-bit BCH) or BHERR0~1 (4-bit BCH) to memory pointed by DTAR0 or if there is no error in the data block, DMA will only write BHINT to memory, and then DMA clear BHINT and set BCH reset to BCH. If multiple data block are linked to wait for BCH decoding, data transfer and decoding can be executed in pipeline, that is when the first data block is being decoding, and second data can be transfer to BCH for syndrome generation.

Here one data block means, for encoding, the entire data bytes need encoding, for decoding, the entire data bytes and parity bytes need decoding. DCM.BLAST must be used in descriptor BCH transfer. When one data block is in a continuous memory space, BLAST must be set to 1 for this data block; when one data block is linked in multiple data space, BLAST must be set to 1 for the last data space.

5.3.1.4 Nand Transfer

5.3.2 No-Descriptor Transfer

To do proper DMA transfer, do as following steps:

First of all, check whether the status of DMA controller are available, that is, for global control (DMAC), ensure that DMAC.AR=0 and DMAC.HLT=0; while for expected channels, ensure that DCSn.AR=0, DCSn.HLT=0 and DCSn.TT=0 and DTCn=0.

one nand request detection

- 1 For each channel n, initialize DSAn, DTAn, DTCn, DRTn, DCSn, DCMn properly
- 2 Set DMAC.DMAE=1 and expected DCSn.CTE=1 and DCSn.NDES=1 to launch DAM transfer

For a channel with auto-request (DRTn.RT=0x8), the transfer begins automatically when the DCSn.CTE bit and DMAC.DMAE bit are set to 1. While for a channel with other request types, the transfer does not start until a transfer request is issued and detected.

For any channel n, The DTCn value is decremented by 1 for each successful transaction of a data unit. When the specified number of transfer data unit has been completed (DTCn = 0), the transfer ends normally. Meanwhile corresponding bit of DIRQP is set to 1. If DCMn.TIE bit is set to 1, an interrupt request is sent to the CPU. However, during the transfer, if a DMA address error occurs, the transfer is suspended, both DCSn.AR and DMAC.AR are set to 1 as well as corresponding bit of DIRQP. Then an interrupt request is sent to the CPU despite of DCMn.TIE.

Sometimes, for example, an UART parity error occurs for a channel that is transferring data between such UART and another terminal. In the case, both DCSn.HLT and DMAC.HLT are set to 1 and the transfer is suspended. Software should identify halt status by checking such two bits and re-configure DMA to let DMA rerun properly later.

For non-descriptor BCH transfer, there is no pipeline execution for BCH decoding. DCM.BLAST doesn't need to be set in non-descriptor BCH transfer.

5.4 DMA Requests

DMA transfer requests are normally generated from either the data transfer source or target, but also they can be issued by on-chip peripherals that are neither the source nor the target. There are two DMA transfer request types: auto-request, and on-chip peripheral request. For any channel n, its transfer request type is determined through DRTn.

5.4.1 Auto Request

When there is no explicit transfer request signal available, for example, memory-to-memory transfer or memory to some on-chip peripherals like GPIO, the auto-request mode allows the DMA to automatically generate a transfer request signal internally. Therefore, when DMA initialization done, once the DMAC.DMAE and DCSn.CTE are set to 1, the transfer begins immediately in channel n which DRTn=0x8.

5.4.2 On-Chip Peripheral Request

In the mode, transfer request signals come from on-chip peripherals. All request types except 0x8 (value of DRT) belong to the mode. Note: the transfer byte number for one request detection according to DCMn.RDIL must be equal or less than the byte number according to receive or transmit trigger value of source or target devices.

5.5 DMA Transfer Modes

Each channel can toggles between two transfer modes: single and block

5.5.1 Single Mode

A channel with single mode will periodically detect the request signal according to presetting detection interval length (DCMn.RDIL). Moreover, during the transfer, after a transaction of a data unit (8-bit, 16-bit, 32-bit, 16-byte, or 32-byte), an internal arbitrator in the DMA will arbitrate all active channels again to select one to represent DMA's bus request to participate the AHB bus arbitration. Above process will repeat when the channel captures the bus again until corresponding DCSn.TT bit equals to 1 or abnormal situation (address error, halt) occurs.

5.6 Channel Priorities

There are two dma cores, each one supports 6 channels dma transfer. The two cores have the same priority.

In each core, there are two sets: set 1 has the higher priority than set 2, within each set priority is round robin.

Table 5-5 Relationship among DMA Transfer connection, Request Mode and Transfer Mode

Transfer Connection	Request	Transfer	Data Size (bits)	Channel
	Mode	Mode		
External memory or memory-mapped	Auto	Single	8/16/32	0~5
external device and on-chip	on-chip		16-byte/32-byte	
peripheral module				

5.7 Examples

5.7.1 Memory-to-memory auto request No-Descriptor Transfer

Suppose you want to do memory move between two different memory regions through channel 3, for example, moving 1KB data from address 0x20001000 to 0x20011000, do as following steps:

- 0 Check if (DMAC.AR==0 && DMAC.HLT==0 && DCS3.AR==0 && DCS3.HLT==0 && DCS3.CT==0 && DCS3.NDES=1 && DTC3==0)
- 1 If above condition is true, set value 0 to DCS3.CTE to disable the channel 3 temporarily
- 2 Set source address 0x20001000 to DSA3 and target address 0x20011000 to DTA3
- 3 Suppose the data unit is word, set transfer count number 256 (1024/4) to DTC3
- 4 Set auto-request (0x8) to DRT3
- 5 Up to now, only the most important channel control register DCM3 is left, set it carefully:
- 0 Set value 1 to SAI and DAI^{*1}
- 1 Ignore RDIL because in the case there is no explicit request signal can be detected
- 2 Set word size (0) to SP and DP²
- 3 Set single mode (0) to TM*3
- 4 Set value 1 to TIE to let CPU do some post process after the transfer done
- 6 Set value 1 to DCS3.CTE and DMAC.DMAE to launch the transfer in channels 3
- 7 When the transfer terminates normally (DTC3==0 && DCS3.TT==1), DIRQP.CIRQ3 will automatically be set value 1 and an interrupt request will be sent to CPU
- When CPU grants the interrupt request, in the corresponding IRQ handler, software must clear the DCS3.CT to value 0, and the behavior will automatically clear DIRQP.CIRQ3.

NOTES:

- Either source or target is a FIFO, must not enable corresponding address increment
- When either source or target need be accessed through EMC (external memory controller), the real port with of the device is encapsulated by EMC, so you can set any favorite port with for it despite of the real one

6 AHB Bus Arbiter

6.1 Overview

AHB bus arbiter is responsible for AHB bus transactions' arbitrating to provide a fair chance for each AHB master to possess the AHB bus. The refined arbiter in this processor adopts a new arbitrating technique to fulfill the back-to-back feature of AHB protocol. Moreover, dividing two master groups with different privileges supports two arbitrating methods:

- 1. Round-robin possession for masters in the same group
- 2. Preemptive possession for masters with higher privileges

There are two AHB buses in this processor, AHB0 and AHB1. AHB0 is responsible for interconnecting 8 main AHB masters including main CPU core, LCD, IPU, CIM, DMA, USB, the bridge for AHB1 and the bridge for MC. While the AHB1 is responsible for interconnecting 8 AHB masters belonging to video processor including auxiliary CPU core, MC, ME, IDCT, DBLK, DDMA0 for TCSM0, DDMA1 for TCSM1 and the bridge for main CPU core.

6.2 Register Descriptions

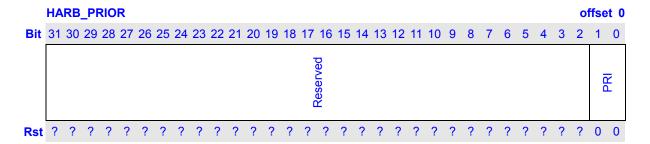

The base address for memory-mapped registers in the AHB0 bus' arbiter is 0x13000000. The AHB1 bus' arbiter has the same base address as the AHB0, but its memory-mapped registers can only be accessed by auxiliary CPU core.

Table 6-1 AHB Bus Arbiter Registers List

Register	Offset	Size	R/W	Reset	Description				
Name				Value	Description				
RPIOR	0x00	32	R/W	0x00000000	Master group priority order				
CTRL	0x04	32	R/W	0x00000000	AHB monitor control *1				
CLKL	0x08	32	R/W	0x00000000	AHB clock counter low *1

6.2.3 AHB Clock Counter Low Register

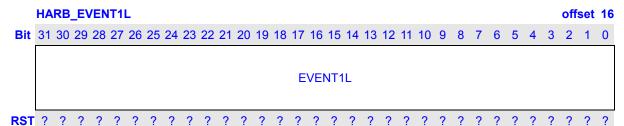

Bits	Name	Description	R/W
31:0	CLKL	Record the low 32 bits of AHB clock counter	RW

6.2.4 Event0 Low Register

Bi	ts	Name	Description	R/W
31:	0	EVENT0L	Record the low 32 bits of event 0 counter	RW

6.2.5 Event1 Low Register

Bits	Name	Description	R/W
31:0	EVENT1L	Record the low 32 bits of event 1 counter	RW

6.2.6 Event High Register

Bits	Name	Description	R/W
31:16	CLKH	Record the high 16 bits of AHB clock counter	RW
15:8	EVENT1H	Record the high 8 bits of event 1 counter	RW
7:0	EVENT0H	Record the high 8 bits of event 0 counter	RW

Note that fields of EVENTH register will not overflow automatically. For example, when EVENT1H reaches 0xFF during monitoring, it remains the value until software modifies it.

7 Clock Reset and Power Controller

7.1 Overview

The Clock & Power management block consists of three parts: Clock control, PLL control, and Power control, Reset control.

The Clock control logic can generate the required clock signals including CCLK for CPU, AUX_CCLK for AUX_CPU, H0CLK for the AHB0 bus peripherals, H1CLK for the AHB1 bus peripherals, and PCLK for the APB bus peripherals. The Chip has one Phase Locked Loops (PLL): for CCLK, AUX_CCLK, H1CLK, H0CLK and PCLK, MSCLK, SSICLK, LPCLK. The clock control logic can make slow clocks without PLL and connect/disconnect the clock to each peripheral block by software, which will reduce the power consumption.

For the power control logic, there are various power management schemes to keep optimal power consumption for a given task. The power management block can activate four modes: NORMAL mode, DOZE mode, IDLE mode, SLEEP mode.

For reset control logic, the hardware reset and hibernate reset is extended to more 40ms. It controls or distributes all of the system reset signals.

7.2 Clock Generation UNIT

The clock generation unit (CGU) contains one PLL driven by an external oscillator and the clock generation circuit from which the following clocks are derived:

Signal	Description
CCLK	Fast clock for internal operations such as executing instructions from the
	cache. It can be gated during doze and idle mode when all the criteria to
	enter a low power are met.
AUX_CCLK	AUX CPU Clock as the same frequency as CCLK
H1CLK	AHB1 High Speed Bus Clock
H0CLK	System clock—This signal appears as the HCLK input to the CPU and the
	HCLK to the system. This is a continuous clock (when the system is not in
	sleep mode) It can be gated during Sleep mode when all the criteria to
	enter a low power are met
PCLK	Peripheral clock – APB BUS device clock
MCLK	Clock for EMC controller
СКО	SDRAM Clock
LPCLK	LCD pixel clock
TVECLK	TV encoder 27M clock
CIM_MCLK	Clock output from CIM module
CIM_PCLK	Clock input to CIM module
I2SCLK	I2S codec clock
BITCLK	AC97 bit clock
MSC0CLK	MSC0 clock
MSC1CLK	MSC1 clock
SSICLK	SSI0 clock
TSSICLK	TSSI clock
EXCLK	12M clock output for UART I2C TCU USB2.0-PHY AUDIO CODEC

Feature:

- On-chip 2MHz~27MHZ oscillator circuit
- On-chip 32.768KHZ oscillator circuit
- One On-chip phase-locked loops (PLL) with programmable multiplier
- CCLK, AUX_CCLK, PCLK, H1CLK, H0CLK, MCLK, CKO and LPCLK, I2SCLK, MSC0CLK, MSC1CLK, SSICLK frequency can be changed separately for software by setting registers.
- SSI clock supports 50M clock
- MSC clock supports 50M clock
- Functional-unit clock gating

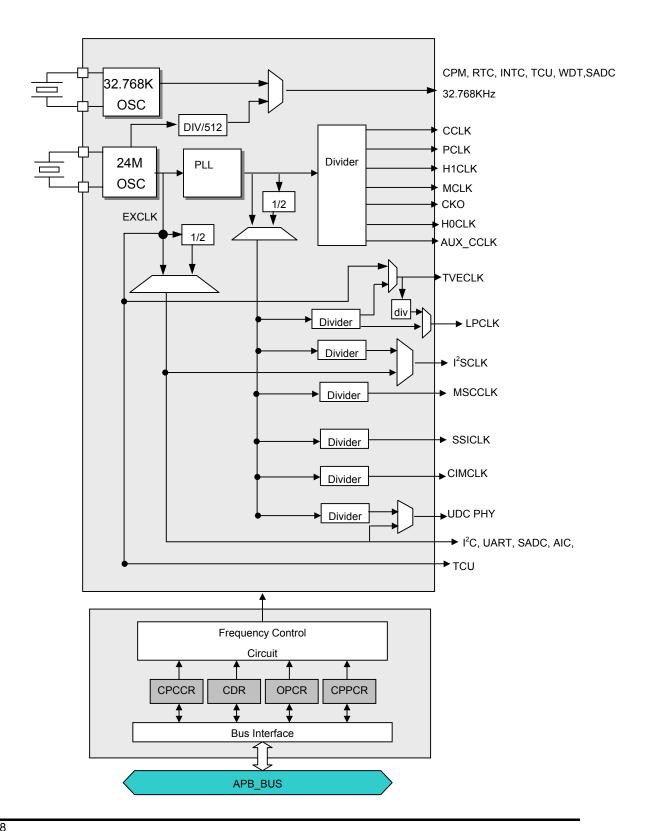

7.2.1 Pin Description

Name	I/O	Description
RTCLK_XI	Input	32.768KHZ Oscillator input signal
RTCLK_XO	Output	32.768KHZ Oscillator output signal
EXCLK	Input	Oscillator input signal
EXCLKO	Output	Oscillator output signal
CIM_MCLK	Output	Clock output from CIM module signal
CIM_PCLK	Input	Clock input to CIM module signal
LPCLK	Output	LCD pix clock signal
CKO	Output	SDRAM clock signal
TSSICLK	Input	TSSI clock signal
BITCLK	Inout	I2S/AC97 bit clock
MSC0_CLK	Output	Clock output For MMC0/SD0 Card signal
MSC1_CLK	Output	Clock output For MMC1/SD1 Card signal
SSI_CLK	Output	Clock output from SSI module signal

7.2.2 CGU Block Diagram

Following figure illustrates a block diagram of CGU

7.2.3 Clock Overview

There is an internal PLL . PLL input clock is an external input clock EXCLK. Theoretically, EXCLK can be 2MHz ~ 27MHz.

CCLK is CPU clock. It is usually the fastest clock in the chip. This clock represents the chip speed.

AUX CCLK is AUX CPU clock.

H0CLK is for on chip high speed peripherals connected to AHB0 bus.

H1CLK is for on chip high speed peripherals connected to AHB1 bus.

PCLK is for on chip slow speed peripherals connected to APB bus.

MCLK is external memory bus clock. MCLK represents the SDRAM speed.

CCLK, AUX_CCLK, H1CLK, H0CLK, PCLK and MCLK are synchronous clocks that may have different frequencies. They are from the same clock source, the on chip PLL output clock in most cases. H0CLK frequency can be equal to CCLK or divided CCLK by an integer. PCLK frequency can be equal to H0CLK or divided H0CLK by an integer. MCLK frequency can be equal to or half of HCLK. H0CLK frequency can be equal to H1CLK or H0CLK/H1CLK = 3/2.

AC97 in AIC module needs a 12.288MHz BIT clock. It is input from the external AC97 CODEC chip or other clock source.

Besides PLL input, EXCLK also provides device clock or one of device clocks for many peripherals, such as, UART, I2C, TCU, SSI, SADC and WDT

Device clock of MSC (MMC/SD) is taken from software divided PLL output clock. Device clock of SSI is taken from software divided PLL output clock.

LCD's pixel clock are generated from PLL output clock, which are divided by two independent dividers.

The slowest clock is RTCLK, which is usually 24M/512 or 32768Hz

7.2.4 CGU Registers

All CGU register 32bit access address is physical address.

Table 7-1 CGU Registers Configuration

Name	description	RW	Reset Value	Address	Access
					Size
CPCCR	Clock Control Register	RW	0x42040000	0x10000000	32
CPPCR	PLL Control Register	RW	0x28080011	0x10000010	32

7.2.4.2 I2S device clock divider Register

I2S device clock divider Register (I2SCDR) is a 32-bit read/write register that specifies the divider of I2S device clock . This register is initialized to 0x00000004 only by any reset. Only word access can be used on I2SCDR

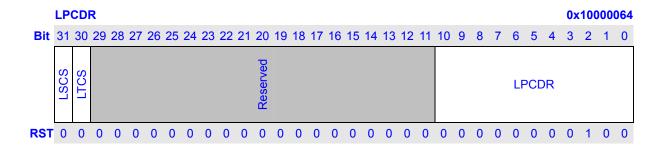

Bits	Name	Description	RW
31:9	Reserved	Writes to these bits have no effect and always read as 0.	R
8:0	I2SCDR	Divider for I2S Frequency. Specified the I2S device clock division ratio,	RW
		which varies from 1 to 512 (division ratio = I2SCDR + 1).	
		When EXCLK is 24M, don't care the bit	

7.2.4.3 LCD pix clock divider Register

LCD pix clock divider Register (LPCDR) is a 32-bit read/write register that specifies the divider of LCD pixel clock (LPCLK). This register is initialized to 0x00000004 only by any reset. Only word access can be used on LPCDR

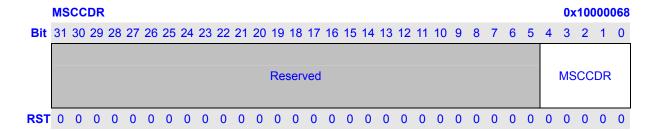

Bits	Name	Description	RW
31	LSCS	TV encoder Source Pixel Clock Selection. Selects the TV encoder source	RW
		pixel clock between divider and external clock input	
		0: TV encoder source pixel clock source is PLL divider output	
		1: TV encoder source clock source is EXCLK PIN	
30	LTCS	LCD TV Encoder or Panel pix clock Selection	RW
		0: pix clock is used as LCD PANEL	
		1: pix clock is used as TV ENCODER	
29:11	Reserved	Writes to these bits have no effect and always read as 0.	R
10:0	LPCDR	Divider for Pixel Frequency. Specified the LCD pixel clock (LPCLK)	RW
		division ratio, which varies from 1 to 2048 (division ratio = LPCDR + 1).	

7.2.4.4 MSC device clock divider Register

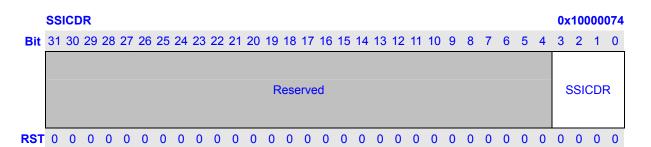

MSC device clock divider Register (MSCCDR) is a 32-bit read/write register that specifies the divider of MSC device clock . This register is initialized to 0x00000000 only by any reset. Only word access can be used on MSCCDR

Bits	Name	Description	RW
31:5	Reserved	Writes to these bits have no effect and always read as 0.	R
4:0	MSCCD	Divider for MSC Frequency. Specified the MSC device clock division	RW
	R	ratio, which varies from 1 to 32 (division ratio = MSCCDR + 1).	

7.2.4.5 SSI device clock divider Register

SSI device clock divider Register (SSICDR) is a 32-bit read/write register that specifies the divider of SSI device clock. This register is initialized to 0x00000000 only by any reset. Only word access can be used on SSICDR

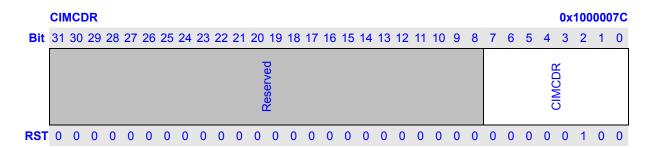

Bits	Name	Description	RW
31:4	Reserved	Writes to these bits have no effect and always read as 0.	R
3:0	SSICDR	Divider for SSI Frequency. Specified the SSI device clock division	RW
		ratio, which varies from 1 to 16 (division ratio = SSICDR + 1).	

7.2.4.6 CIM MCLK clock divider Register

CIM mclk clock divider Register (CIMCDR) is a 32-bit read/write register that specifies the divider of CIM mclk clock (CIM_MCLK). This register is initialized to 0x00000004 only by any reset. Only word access can be used on CMCDR

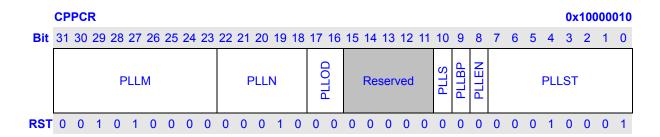

Bits	Name	Description	RW
31:8	Reserved	Writes to these bits have no effect and always read as 0.	R
7:0	CIMCDR	Divider for CIM MCLK Frequency. Specified the CIM MCLK clock	RW
		(CIM_MCLK) division ratio, which varies from 1 to 256 (division ratio =	
		CIMCDR + 1).	

7.2.4.7 PLL Control Register

The PLL Control Register (CPPCR) is a 32-bit read/write register, which controls PLL multiplier, on/off state and stabilize time. It is initialized to 0x28080011 only by any reset. Only word access can be used on CPPCR.

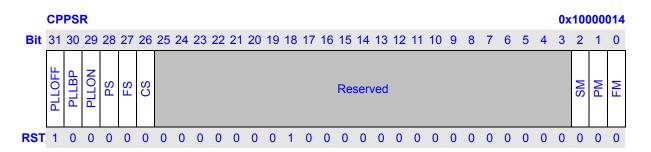

Bits	Name	Description	RW
31:23	PLLM	the PLL feedback 9-bit divider	RW
22:18	PLLN	the PLL input 5-bit divider	RW
17:16	PLLOD	00: divide by 1	RW
		01: divide by 2	
		10: divide by 2	
		11: divide by 4	
15:11	Reserved	Writes to these bits have no effect and always read as 0	R
10	PLLS	PLL Stabilize Flag	R
		0: PLL is off or not stable	
		1: PLL is on and stable	
9	PLLBP	PLL Bypass. If PLLEN is 1, set this bit to1 will bypass PLL. The PLL is still	RW
		running background but the source of associated dividers is switched to	
		12-M. If PLLEN is 0, set this bit to 1 has no effect. If PLLEN is 1, clear this	
		bit to 0 will switch the source of associated dividers to PLL output.	
8	PLLEN	PLL Enable. When PLLEN is set to 1, PLL starts to lock phase. After PLL	RW
		stabilizes, PLLS bit is set. If PLLBP is 0, the source of associated dividers,	
		is switched to PLL output. When PLLEN is clear to 0, PLL is shut off and	
		the source of associated dividers is switched to 12-MHz in spite of PLLBP	
		bit	
7:0	PLLST	PLL Stabilize Time. Specifies the PLL stabilize time by unit of RTCCLK	RW
		(approximate 32kHz) cycles. It is used when change PLL multiplier or	
		change PLL from off to on. It is initialized to H'11	

7.2.4.8 PLL Switch and Status Register

The PLL Switch and Status Register (CPPSR) is a 32-bit read/write register, which controls the clock switch ,frequency change mode and reflect the PLL and clock switch Status .It is initialized to 0x80000000 by any reset. Only word access can be used on CPPSR.

Bits	Name	Description	RW
31	PLLOFF	0 : PLL doesn't enter shut off state	R
		1: PLL is in shut off state	
30	PLLBP	0: PLL doesn't enter by pass state	R
		1: PLL is in by pass state	
29	PLLON	0: PLL doesn't enter on state	R
		1: PLL is in on state	
28	PS	0: disable PLL or no change PLL parameters	RW
		1: enable PLL or change PLL parameters have finished.	
		The bit is asserted to 1 auto by hardware . when software concerns this	
		bit, at first software write 0 to the bit, then read the status bit until to 1.	
27	FS	Indicate the change frequency has finished . the bit only reflect CDIV,	RW
		HDIV, MDIV, PDIV change .	
		0 : no change CDIV, HDIV, MDIV, PDIV	
		1: change clock parameters have finished.	
		when software concerns this bit, at first software write 0 to the bit, then	
		read the status bit until to 1	
26	CS	Indicate the clock switch has finished, the bit reflects when PLL switch to	RW
		EXCLK or EXCLK to PLL.	
		0: no clock switch	
		1: clock switch has finished.	
		when software concerns this bit, at first software write 0 to the bit, then	
		read the status bit until to 1	
25:3	Reserved		R
2	SM	When cdiv hdiv mdiv pdiv change, whether cclk h1clk h0clk mclk pclk	RW
		are all stopped	
		0: hardware control	
		1: when frequency changes, above clocks are all stopped	
1	PM	Clock switch mode. When PLL switch to EXCLK or EXCLK switch to PLL	RW

		0: slow mode	
		1: fast mode	
0	FM	Clock frequency change mode. Only to CDIV MDIV HDIV PDIV	RW
		0: slow mode	
		1: fast mode	

7.2.5 PLL Operation

The PLL developed as a macro cell for clock generator. It can generate a stable high-speed clock from a slower clock signal. The output frequency is adjustable and can be up to 500MHz. The PLL integrates a phase frequency detector (PFD), a low pass filter (LPF), a voltage controlled oscillator (VCO) and other associated support circuitry. All fundamental building blocks as well as fully programmable dividers are integrated on the core. It is useful for clock multiplication of stable crystal oscillator sources and for de-skew clock signals.

The PLL block diagram is shown in following figure

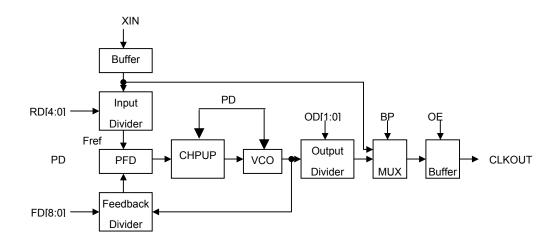

Figure 7-1 Block Diagram of PLL

7.2.5.1 PLL Configuration

- PLL Divider Value Setting
 There are 3 divider values (N, M and NO) to set the PLL output clock frequency CLKOUT:
- Input Divider Value N

N = PLLN of CPPCR + 2

2. Feedback Divider Value M

M = PLLM of CPPCR + 2

3. Output Divider Value NO

Output Divider Setting (OD)	Output Divider Value (NO)
0	1
1	2
2	2
3	4

4. The PLL output frequency, CLK_OUT, is determined by the ratio set between the value set in the input divider and the feedback divider. PLL output frequency CLK_OUT is calculated from the following equations:

CLKOUT = XIN x
$$(M/N)$$
 x $(1/N0)$

$$M = F0 *1 + F1*2 + F2*4 + F3*8 + F4*16 + F5*32 + F6*64 + F7*128 + F8*256 + 2$$

$$N = R0*1 + R1*2 + R2*4 + R3*8 + R4*16 + 2$$

$$NO = 2^{od0+od1}$$

Where:

CLK_OUT represents the output frequency
XIN represents PLL input frequency
N represents input divider value
M represents feedback divider value
NO represents output divider value

< Attention >

- 1. $1MHZ \le XIN/N \le 15MHZ$
- 2. $100MHZ \le CLK_OUT \times NO \le 500MHZ$

7.2.5.2 PLL out clock frequency selection

```
PLL-freq = PLL-freq-raw / NO, where NO = 1, 2, 4
PLL-freq-raw = EXCLK * M / N, where M = integer of 2 \sim 513, N = integer of 2 \sim 33
```

So, to generate a specified PLL-freq, there are many valid sets of NO, M and N value.

Smaller PLL-freq-raw is better since it consumes less power. Reduce PLL-freq-raw from 200MHz to 100MHz saving a few milliwatts. Please beware not put PLL-freq-raw less than 100MHz.

If EXCLK is in small jitter, like a crystal-generated clock, a smaller N is better.

7.2.6 Main Clock Division Change Sequence

Main clock (CCLK, H1CLK, H0CLK, PCLK and MCLK) frequencies can be changed separately or simultaneously by changing division ratio. Following conditions must be obeyed:

- 1. CCLK must be integral multiple of H1CLK, H0CLK
- 2. The frequency ratio of CCLK and H0CLK can not be 24 and 32
- 3. H0CLK must be equal to MCLK or twice of MCLK
- H0CLK and MCLK must be integral multiple of PCLK.
- 5. H0CLK must be equal to H1CLK or half of H1CLK or 2/3 of H1CLK

Don't violate this limitation, otherwise unpredictable error may occurs.

In normal mode, if CE bit of CPCCR is 1, changing CDIV, H0DIV, H1DIV, PDIV or MDIV will start a Division Change Sequence immediately. If CE bit of CPCCR is 0, changing CDIV, H1DIV, H0DIV, PDIV or MDIV will not start Division Change Sequence.

7.2.7 Change Other Clock Frequencies

The divider of LCD pixel clock (LPCLK), I2S device clock, SSI device clock, MSC device clock and USB clock can be changed by programming LPCDR, I2SCDR, SSICDR, MSCCDR and UDIV, respectively.

Change LPCDR I2SCDR SSICDR MSCCDR and UDIV as following steps:

- 1.3 Stop related devices with clock-gate function. Clock supplies to the devices are stopped.
- 1.3 Change LPCDR, I2SCDR, SSICDR, MSCCDR or UDIV. If CE is 1, clock frequencies are changed immediately. If CE is 0, clock frequencies are not changed until PLL Multiplier Change Sequence is started.
- 1.3 Cancel above clock-gate function.

7.2.8 Change Clock Source Selection

USB, I2S device clocks and LCD pix clock can be selected from two sources. Before change clock source, corresponding devices should be stopped using clock-gate function.

- a) When USB clock source is changed (UCS bit of CPCCR), USB clock should be stopped.
- b) When I2S clock source is changed (I2CS bit of CPCCR), AIC should be stopped.
- c) When LCD pix clock source is changed (LSCS LTCS bit of LPCDR), LCD should be stopped

When UCS, I2CS, LTCS bit is changed, clock source is changed immediately.

When PCS of CPPCR is changed, the LCD AIC MSC SSI clock should be stopped When ECS of CPCCR is changed, the UART SADC I2C clock should be stopped.

7.2.9 EXCLK Oscillator

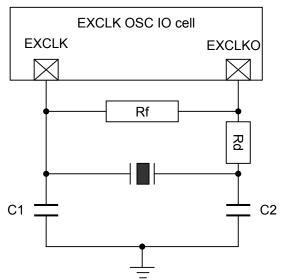

Figure 7-2. Oscillating circuit for fundamental mode

To turn on the oscillator, the oscillating circuit must provide the negative resistance (-Re) at least five times the equivalent series resistance (ESR) of the crystal sample. For larger -Re value, faster turn on the crystal. Higher gm provides larger -Re therefore can start-up the crystal with higher ESR for the same load capacitance (CL). However, it's required higher power consumption.

There are two key parameters to turn on oscillator. Which are CL and the maximum ESR at the target frequency. By reducing the CL, the -Re can be increased thus; shorter turn on time can be achieved. However, if CL is too small, the deviation from the target frequency will increase because of the capacitance variation. So, a trade-off relationship between short turn on time and small frequency deviation in deciding CL value. The smaller ESR of the crystal sample will reduce turn on time but the price is higher. The typical CL and ESR values for difference target frequencies are listed in Table 2.

Table 2 Typical CL and the corresponding maximum ESR

Target Frequency (Hz)	2M ~ 3M	3M ~ 6M	6M ~ 10M	10M ~ 20M
CL (pf)	25	20	16	12
Maximum ESR (ohm)	1K	400	100	80

Figure 7-2 shows the oscillating circuit is connected with the oscillator I/O cell. Components feedback resistor (Rf), damping resistor (Rd), C1 and C2 are used to adjust the turn on time, keep stability and accurate of the oscillator.

Rf is used to bias the inverter in the high gain region. It cannot be too low or the loop may not

oscillate. For mega Hertz range applications, Rf of 1Mohm is applied.

Rd is used to increase stability, low power consumption, suppress the gain in high frequency region and also reduce -Re of the oscillator. Thus, proper Rd cannot be too large to cease the loop oscillating.

C1 and C2 are deciding regard to the crystal or resonator CL specification. In the steady state of oscillating, CL is defined as (C1*C2)/(C1+C2). Actually, the I/O ports, bond pad, and package pin all contribute the parasitic capacitance to C1 and C2. Thus, CL can be rewrite to (C1'*C2')/(C1'+C2'), where C1'=(C1+Cin,stray) and C2'=(C2+Cout,stray). In this case, the required C1 and C2 will be reduced.

Notice, this oscillating circuit is for parallel resonate but not series resonate. Because C1, C2, Rd and Rf are varying with the crystal specifications; therefore there is no single magic number of all the applications.

7.3 Power Manager

In the Low-Power mode, part or whole processor is halted. This will reduce power consumption. The Power Management Controller contains low-power mode control and reset sequence control

7.3.1 Low-Power Modes and Function

The processor supports six low-power modes and function:

NORMAL mode

In Normal mode, all peripherals and the basic blocks including power management block, the CPU core, the bus controller, the memory controller, the interrupt controller, DMA, and the external master may operate completely. But, the clock to each peripheral, except the basic blocks, can be stopped selectively by software to reduce the power consumption.

DOZE mode

DOZE mode is entered by setting DOZE bit of LCR to 1. In DOZE mode, clock is burst to CPU core and the clock duty is set by DUTY field of LCR. DOZE mode is canceled by reset, interrupt or clearing DOZE bit to 0. Continuous clock is supplied immediately after DOZE mode is canceled. The other Clocks except CCLK run continuously in DOZE mode.

IDLE mode

In IDLE mode, the clock to the CPU core is stopped except the bus controller, the memory controller, the interrupt controller, and the power management block. To exit the IDLE mode,

the any interrupts should be activated.

SLEEP mode

In SLEEP mode, all clocks except RTC clock are disabled. PLL is disabled also. SLEEP mode is canceled by reset or interrupt. When SLEEP mode is canceled, PLL is restarted, the PLL needs clock stabilization time (PLL lock time). This PLL stabilization time is automatically inserted by the internal logic with lock time count register, and all clocks start operating after PLL stability time.

CLOCK GATE function

CLOCK GATE function is used to gate specified on-chip module when it is not used. Set specified CLKG0~24 bits in CLKGR will enter specified CLK gate function. CLOCK gate function is canceled by reset or clearing specified CLKGR0~24 to 0.

7.3.2 Register Description

All PMC register 32bit access address is physical address.

Table 7-3 Power/Reset Management Controller Registers Configuration

Name	description	RW	Initial Value	Address	Access
					Size
LCR	Low Power Control Register	RW	0x000000F8	0x10000004	32
CLKGR	Clock Gate Register	RW	0x00000000	0x10000020	32
OPCR	Oscillator and Power Control Register	RW	0x00001500	0x10000024	32

7.3.2.1 Low Power Control Register

The Low Power Control Register (LCR) is a 32-bit read/write register that controls low-power mode status. It is initialized to 0x000000F8 by any reset.

	LC	R																											0 x	100	000	04

7.3.2.3 Oscillator and Power Control Register (OPCR)

The Oscillator and Power Control Register is a 32-bit read/write register that specifies some special controls to oscillator and analog block. It is initialized to 0x00001500 by reset.

Bits	Name	Description	RW
31:16	Reserved	Writes to these bits have no effect and always read as 0	R

me by unit of 16 RTCCLK periods (oscillator 768) cycles. It is initialized to H'15.	RW

7.3.3 Doze Mode

Firstly, software should set the DUTY bits of LCR. Then set DOZE bit of LCR to 1 to enter doze mode. When slot controller of PMC indicates that the CPU clock's time-slot has expired, CPU is halted but its register contents are retained. During doze mode, program can modify clock duty-cycle according to core resource requirement. Clock control is in increments of approximately 3% (1/31).

Doze is exited by software, interrupt, reset or SLEEP instruction.

7.3.4 IDLE Mode

In normal or mode, when LPM bits in LCR are 0 and SLEEP instruction is executed, the processor enters idle mode. CPU is halted but its register contents are retained All critical application must be finished and peripherals must be configured to generate interrupts when they need CPU attention.

The procedure of entering sleep mode is shown blow:

- Set LPM bits in LCR to 0.
- Executes SLEEP instruction.
- When current operation of CPU core has finished and CPU core is idle, CCLK supply to CPU core is stopped.

IDLE mode is exited by an interrupt (IRQ or on-chip devices) or a reset.

7.3.5 SLEEP Mode

In normal mode, when LPM bits in LCR is 1 and SLEEP instruction is executed, the processor enter SLEEP mode. CPU and on-chip devices are halted, except some wakeup-logic. PLL is shut off. Clock output from CKO pin is also stopped. SDRAM content is preserved by driving into self-refresh state. CPU registers and on-chip devices registers contents are retained

Before enter SLEEP mode, software should ensure that all peripherals are not running. The procedure of entering SLEEP mode is shown blow:

- 1. Set LPM bit in LCR to 1.
- 2. Execute a SLEEP instruction.
- 3. When current access on system bus complete, the arbiter will not grant any following request. EMC will drive SDRAM from auto-refresh mode to self-refresh mode.
- 4. When system bus is idle state and SDRAM is self-refresh mode, internal clock supplies are stopped.

SLEEP mode can be exited by an interrupt (IRQ or on-chip devices), WDT reset or a poweron reset via the RESETP pin.

7.4 Reset Control Module

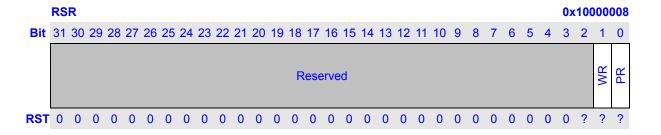

7.4.1 Register Description

All RCM register 32bit access address is physical address.

Name	description	RW	Initial Value	Address	Access Size
RSR	Reset Status Register	RW	0x????????	0x10000008	32

7.4.1.1 Reset Status Register (RSR)

The Reset Status Register (RSR) is a 32-bit read/write register which records last cause of reset. Each RSR bit is set by a different source of reset. Please refer to Reset Sequence Control for reset sources description.

Bits	Name	Description	RW
31:2	Reserved	Writes to these bits have no effect and always read as 0	R
1	WR	WDT Reset. When a WDT reset is detected, WR is set and remains set	RW
		until software clears it or another reset occurs. This bit can only be written	
		with 0. Write with 1 will be ignored	
		0: WDT reset has not occurred since the last time the software clears this	
		bit	
		1: WDT reset has occurred since the last time the software clears this bit	
0	PR	Power On Reset. When a poweron reset via PRESET pin is detected, PR	RW
		is set and remains set until software clears it or another reset occurs. This	
		bit can only be written with 0. Write with 1 is ignored	
		0: Power on reset has not occurred since the last time the software clears	
		this bit	
		1: Power on reset has occurred since the last time the software clears	
		this bit	

7.4.2 Power On Reset

Power on reset is generated when PRESET pin is driven to low. Internal reset is asserted immediately. All pins return to their reset states. The Power on reset is extended to 40MS

PRESET pin must be held low until power stabilizes and the EXCLK oscillator stabilize. CPU and peripherals are clocked by EXCLK oscillator output directly. PLL is reset to off state. All internal modules are initialized to their predefined reset states.

7.4.3 WDT Reset

WDT reset is generated when WDT overflow. Internal reset is asserted within two RTCCLK cycles. All pins return to their reset states.

Then WDT reset source is cleared because of internal reset. The internal reset is asserted for about 10 milliseconds. CPU and peripherals are clocked by EXCLK oscillator output directly. PLL is reset to off state.

8 Real Time Clock

8.1 Overview

The Real-Time Clock (RTC) unit can be operated in either chip main power is on or the main power is down but the RTC power is still on. In this case, the RTC power domain consumes only a few micro watts power.

The RTC contains a 32768Hz oscillator, the real time and alarm logic, and the power down and wakeup control logic

8.1.1 Features

RTC module has following features:

- Embedded 32768Hz oscillator for 32k clock generation with an external 32k crystal
- RTCLK selectable from the oscillator or from the divided clock of EXCLK, so that 32k crystal
 can be absent if the hibernating mode is not needed
- 32-bits second counter
- Programmable and adjustable counter to generate accurate 1 Hz clock
- Alarm interrupt, 1Hz interrupt
- Stand alone power supply, work in hibernating mode
- Power down controller
- Alarm wakeup
- External pin wakeup with up to 2s glitch filter

8.1.2 Signal Descriptions

RTC has 5 signal IO pins and 1 power pin. They are listed and described in.

Pin Names	Pin Loc	Ю	IO Cell Char.	Pin Description	Power
RTCLK		ΑI	32768Hz	RTCLK: 32768 clock input or OSC input	VDD_{RTC}
RTCLKO		AO		RTCLKO: OSC output	VDD_{RTC}
PWRON		AO	~2mA, Open-Draw	PWRON: Power on/off control of main power	VDD _{RTC}
WKUP_		ΑI	Schmitt	WKUP_: Wake signal after main power down	VDD_{RTC}
PPRST_		ΑI	Schmitt	PPRST_: RTC power on reset and RESET-KEY reset input	VDD_{RTC}
VDDRTC		Р		VDDRTC: 3.3V power for RTC and hibernating mode controlling that never power down	-

RTCLK/RTCLKO pins. We have an embedded oscillator for 32768Hz crystal. These two pins
are the crystal XTALI and XTALO connection pins. If an input clock is used instead, please

input it to RTCLKO pin.

If do not use any clock, hibernate mode will be NOT available any more, and the time will lose if power down.

- PWRON pin: this pin is used to control the main power on/off. Output low voltage means on and high-Z means off.
- WKUP_ pin: hibernating mode wakeup input
- PPRST_ pin: This pin should be set to low voltage only in two cases
- When RTC power is turned on (so that whole chip is power on)
- A RESET-KEY is pressed

Don't set this pin to low voltage when wakeup from hibernating mode. When entering/exiting to/from hibernating mode (in another word, in main power up/down procedure), please avoid putting both WKUP_ and PPRST_ in low voltage. Because the RTC registers, for instance, the second counter and others may be changed.

8.2 Register Description

Table 8-1 Registers for real time clock

Name	Description	RW	Reset Value	Address	Access Size
RTCCR	RTC Control Register	RW	0x00000081 ^{[1][2]}	0x10003000	32
RTCSR	RTC Second Register	RW	0x???????	0x10003004	32
RTCSAR	RTC Second Alarm Register	RW	0x???????	0x10003008	32
RTCGR	RTC Regulator Register	RW	0x0??????	0x1000300C	32

Note:

- 1. Unless otherwise stated, the reset value is for PPRST_ and Hibernating wakeup reset. WDT reset doesn't change the value.
- 2. The reset value can be either of 0x00000081, 0x00000091, 0x00000089, 0x00000099

Table 8-2 Registers for hibernating mode

Name	Description	RW	Reset Value	Address	Access Size
HCR	Hibernate Control Register	RW	0x00000000 ^[1]	0x10003020	32
HWFCR	Wakeup filter counter Register in Hibernate mode	RW	0x0000???0	0x10003024	32
HRCR	Hibernate reset counter Register in Hibernate mode	RW	0x00000??0	0x10003028	32
HWCR	Wakeup control Register in Hibernate mode	RW	0x00000000 ^[1]	0x1000302C	32
HWRSR	Wakeup Status Register in Hibernate mode	RW	0x00000000 ^[1]	0x10003030	32
HSPR	Scratch pattern register	RW	0x???????	0x10003034	32

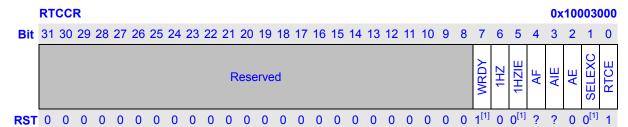

Note: 1. Unless otherwise stated, the reset value is for PPRST_ and Hibernating wakeup reset. WDT reset doesn't change the value.

All these registers, include those for real time clock and for hibernating mode control, except otherwise stated, are implemented in RTCLK clock domain. When write to these registers, it needs about 1 ~ 2 RTCLK cycles to actually change the register's value and needs another RTCLK cycle to allow the next write access. A bit RTCCR.WRDY is used to indicate it. When RCR.WRDY is 1, it means the previous write is finished, a right value can be read from the target register, and a new write access can be issued. So before any write access, please make sure RCR.WRDY = 1.

8.2.1 RTC Control Register (RTCCR)

RTCCR contains bits to configure the real time clock features. Unless otherwise stated, the reset value is for PPRST_ and Hibernating wakeup reset. WDT reset doesn't change the value.

Note: 1. These bits are reset in all resets: PPRST_input pin reset, hibernating reset and WDT reset.

Bits	Name		Description	RW
31:7	Reserved	Writes to these	bits have no effect and always read as 0	R
7	WRDY	Write ready flag	g. It is 0 when a write is currently processing and the value	R
		has not been w	ritten to the writing target register. No write to any RTC	
		registers can b	e issued in this case, or the result is undefined. The read	
		value from the	target register is also undefined. The reading is	
		meaningful and	d another write can be issued when it is 1. Please	
		reference to de	scriptions in 8.2 for some more details. This bit is read	
		only and write	to it is ignored.	
6	1HZ	1Hz flag. This l	oit is set by hardware once every 1 second through the	RW
		1Hz pulse if the	e real time clock is enabled (RTCCR.RTCE = 1). This bit	
		can be cleared	by software. Write 1 to this bit is ignored. Writing to this bit	
		takes effect imi	mediately without delay.	
5	1HZIE	1Hz interrupt e	enable. Writing to this bit takes effect immediately without	RW
		delay.		
		1HZIE	Description	
		0	1Hz interrupt is disabled	
		1	1Hz interrupt is enabled. RTC issues interrupt when	
			1HZ bit is set	
4	AF	Alarm flag. This	s bit is set by hardware when alarm match (RTCSR =	RW
		RTCSAR) is fo	und and alarm is enabled (RTCCR.AE = 1) and the real	
		time clock is er	nabled (RTCCR.RTCE = 1). This bit can be cleared by	
		software. Write	1 to this bit is ignored. Writing to this bit takes effect	
		immediately.		
3	AIE	Alarm interrupt	enable.	RW
		AIE	Description	
		0	Alarm interrupt is disabled	
		1	Alarm interrupt is enabled. RTC issues interrupt	
			when AF is set	

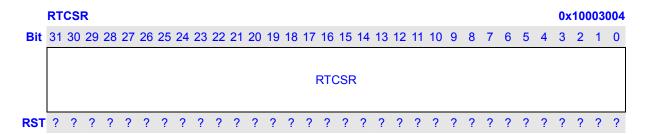

2	AE	Ala	arm enable.		RW
			AE	Description	
			0	Alarm function is disabled	
			1	Alarm function is enabled	
1	SELEXC	Th	e divided EX	CLK is selected as RTCLK in rtc-hiber module.	RW
			SELEXC	Description	
			0	OSC32K or RTCLK input clock is selected as	
				RTCLK in rtc-hiber module	
			1	The divided EXCLK is selected as RTCLK in	
				rtc-hiber module	
		NC	TE: If do no	t use any 32Khz clock (either input clock or using crystal),	
		hib	ernate mode	e will be NOT available any more, and the time will lose if	
		po	wer down.		
		CF	M.OPCR.EF	RCS must be 0, when using SELEXC = 1.	
		W	nen the main	chip power down, SELEXC will be 0 in internal circuit, in	
		thi	s time, RTCL	LK will use OSC32K clock	
0	RTCE	Re	al time clock	enable.	RW
			RTCE	Description	
			0	Real time clock function is disabled	
			1	Real time clock function is enabled	

8.2.2 RTC Second Register (RTCSR)

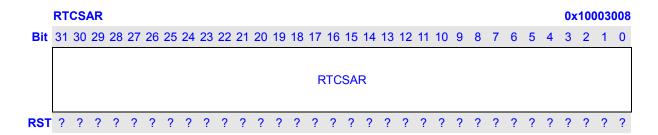

RTCSR is a 32-bit width second counter. It can be read and write by software. It is increased by 1 at every 1Hz pulse if the real time clock is enabled (RTCCR.RTCE = 1). When read, it should be read continued more than once and take the value if the adjacent results are the same. RTCSR is not initialized by any reset.

8.2.3 RTC Second Alarm Register (RTCSAR)

RTCSAR serves as a second alarm register. Alarm flag (RTCCR.AF) is set to 1 when the RTCSR equals the RTCSAR in the condition of alarm is enabled (RTCCR.AE = 1) and the real time clock is enabled (RTCCR.RTCE = 1). RTCSAR can be read and write by software and is not initialized by any reset.

8.2.4 RTC Regulator Register (RTCGR)

RTCGR is serves as the real time clock regulator, which is used to adjust the interval of the 1Hz pulse.

	RT	CG	R																										0 x	100	030	0C
Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Note: 1. This bit is reset in all resets: PPRST_ input pin reset, hibernating reset and WDT reset.

Bits	Name			Description		RW					
31	LOCK	Lock bit.	ck bit. This bit is used to safeguard the validity of the data written into								
		the RTC	RTCGR register. Once it is set, write to RTCGR is ignored. This bit								
		can only	be set	by software and cleared by (any type of) resets.							
		LO	LOCK Description								
		(0 Write to RTCGR is allowed								
		,	1	Write to RTCGR is forbidden							
30:26	Reserved	Writes to	rites to these bits have no effect and always read as 0								
25:16	ADJC	This field	l speci	fies how many times it needs to add one 32kHz cycle fo	or	RW					
		the 1Hz	pulse i	nterval in every 1024 1Hz pulses. In other word, among							
		every 10	24 1H:	z pulses, ADJC number of them are trigged in every							
		(NC1HZ	+ 2) 3	2kHz clock cycles, (1024 – ADJC) number of them are							
		trigged ir	iged in every (NC1HZ + 1) 32kHz clock cycles.								
15:0	NC1HZ	This field	s field specifies the number plus 1 of the working 32kHz clock cycles								
		are conta	ained ii	n the 1Hz pulse interval. In other word, 1Hz pulse is trigg	ed						
		every (N	C1HZ	+ 1) 32kHz clock cycles, if RTCGR.ADJC = 0							

8.2.5 Hibernate Control Register (HCR)

HCR contains the bit to control the main chip power on/off.

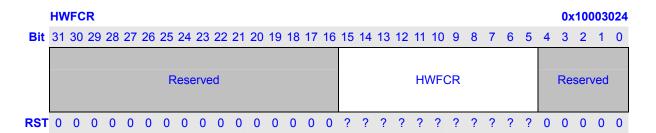

Bits	Name		Description R								
31:1	Reserved	Writes to the	Vrites to these bits have no effect and always read as 0								
0	PD	Power down	or power on	bit. Besides writing by CPU, this bit will be set to	RW						
		1 if an unkno	wn reason n	nain power supply off is detected. This bit							
		controls the F	PWRON pin	level. When co-working with some external							
		components,	this bit is us	ed for power management of this chip. It is							
		supposed wh	upposed when 1 is written to this bit, the main power supply of the chip,								
		except RTC p	ower, will be	e shut down immediately. After this bit is set to 1,							
		all registers i	n RTC modu	ile, except RTCCR.1HZ and RTCCR.1HZIE,							
		cannot be ch	anged by wr	ite access. This bit is cleared by reset pin reset							
		and hibernati	ing reset. Th	e later one is asserted by wakeup procedure.							
		PD	PD PWRON Description								
		0	0 VDDRTC No power down, keep power on								
		1	0 V	Power down enable, turn power off							

8.2.6 HIBERNATE mode Wakeup Filter Counter Register (HWFCR)

The HIBERNATE mode Wakeup Filter Counter Register (HWFCR) is a 32-bit read/write register .It filter the glitch generated by a dedicated wakeup pin. The HRCR is initialized by PPRST_ and WDT reset.

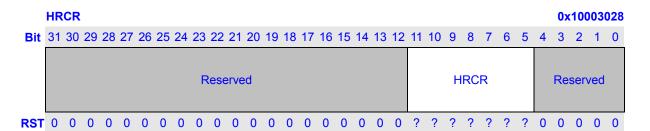

Bits	Name	Description	RW
31:16	Reserved	Writes to these bits have no effect and always read as 0	R
15:5	HWFCR	Wakeup pin effective minimum time in number of 32 RTCLK cycles, used	RW
		as glitch filter logic. Maximum of 2 seconds if the RTCLK is 32768Hz	
4:0	Reserved	Writes to these bits have no effect and always read as 0	R

8.2.7 Hibernate Reset Counter Register (HRCR)

The Hibernate Reset Counter Register is a 32-bit read/write register that specifies hibernate reset assertion time. The HRCR is initialized by PPRST_ and WDT reset

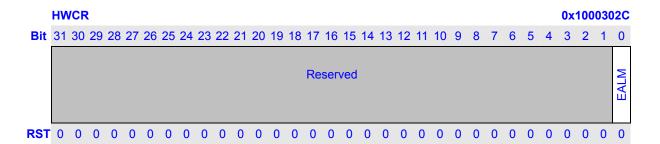

Bits	Name	Description	RW
31:12	Reserved	Writes to these bits have no effect and always read as 0	R
11:5	HRCR	HIBERNATE Reset waiting time. Number of 32 RTCLK cycles. Maximum	RW
		125 ms if the RTCLK is 32768Hz	
4:0	Reserved	Writes to these bits have no effect and always read as 0	R

8.2.8 HIBERNATE Wakeup Control Register (HWCR)

The HIBERNATE Wakeup Control Register is a 32-bit read/write register that controls real time clock alarm wake up enable. The reset value is for PPRST_ and Hibernating wakeup reset. WDT reset doesn't change the value.

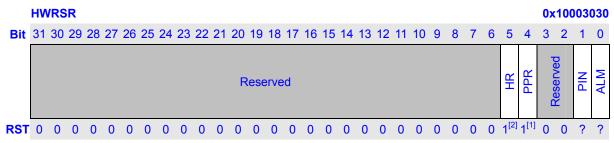

Bits	Name	Description		
31:1	Reserved	Writes to these bits have no effect and always read as 0		
0	EALM	RTC Alarm wakeup enable	RW	
		0: disable		
		1: enable		

8.2.9 HIBERNATE Wakeup Status Register (HWRSR)

The HIBERNATE Wakeup Status Register is a 32-bit read/write register that reflects wakeup status bits.

Note:

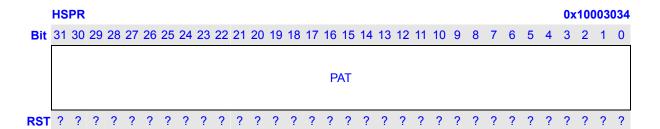

- This reset value only for PPRST_. It is undefined in case of other resets.
- This reset value only for HRST_. It is undefined in case of other resets.

Bits	Name	Description				
31:6	Reserved	Writes to these bits have no effect and always read as 0				
5	HR	Hibernate Reset. When a Hibernate reset detected, HR is set and				
		remains set until software clears it or another reset occurs. This bit can				
		only be written with 0. Write with 1 is ignored				
		HR	Description			
		0	Hibernate reset has not occurred since the last time the			
			software clears this bit			
		1	Hibernate reset has occurred since the last time the			
			software clears this bit			
4	PPR	PAD PIN Reset. When a PPRST_ is detected, PPR is set and remains s				
		until software clears it or another reset occurs. This bit can only be written				
		with 0. Write with 1 is ignored				
		PPR	Description			
		0	PPRST_ reset has not occurred since last time the			
			software clears this bit			
		1	PPRST_ reset has occurred since last time the software			
			clears this bit			
3:2	Reserved	Writes to these bits have no effect and always read as 0				
1	PIN	Status bit. The bit is cleared when chip enters hibernating	RW			
	mode. It is set when exit the hibernating mode by wakeup pin. This					
		only be written with 0. Write with 1 is ignored.				
0	ALM	RTC Alarm Status bit. The bit is cleared when chip enters hibernating				
		mode. It is set when exit the hibernating mode by alarm. This bit can				
		be written wit	th 0. Write with 1 is ignored.			

8.2.10 Hibernate Scratch Pattern Register (HSPR)

This is a scratch register used to hold a pattern. The software can check the pattern is kept to know whether RTC power has ever been down and whether it is needed to setup the real time clock.

Bits	Name	Description	RW
31:0	PAT	The pattern	RW

8.3 Time Regulation

Because of the inherent inaccuracy of crystal and other variables, the time counter may be inaccurate. This requires a slight adjustment. The application processor, through the RTCGR, lets you adjust the 1Hz time base to an error of less than 1ppm. Such that if the Hz clock were set to be 1Hz, there would be an error of less than 5 seconds per month.

To determine the value programmed into the RTCGR, you must first measure the output frequency at the oscillator multiplex (approximately 32 kHz) using an accurate time base, such as a frequency counter. This clock is externally visible by selecting the alternate function of GPIO[?]

To gain access to the clock, program this pin as an output and then switch to the alternate function. To trim the clock, divide the output of the oscillator by an integer value and fractional adjust it by periodically deleting clocks from the stream driving this integer divider.

After the true frequency of the oscillator is known, it must be split into integer and fractional portions. The integer portion of the value (minus one) is loaded into the DIV field of the RTCGR.

The fractional part of the adjustment is done by periodically deleting clocks from the clock stream driving the Hz divider. The trim interval period is hardwired to be 1024 1Hz clock cycles (approximately 17 minutes). The number of clocks (represented by ADC field of RTCGR) are deleted from the input clock stream per trim interval. If ADC is programmed to be zero, then no trim operations occur and the RTC is clocked with the raw 32 kHz clock. The relationship between the Hz clock frequency and the nominal 32 kHz clock (f1 and f32K, respectively) is shown in the following equation.

$$f1 = \frac{2^{10} \times (DIV + 1)}{2^{10} \times (DIV + 1) + ADC} \times \frac{f32k}{DIV + 1}$$

f1 = actual frequency of 1Hz clock

f32k = frequency of either 32.768KHz crystal output or 3.6864MHz crystal output further divided down to 32.914KHz

8.3.1 HIBERNATE Mode

First make sure RTCCR.SELEXC is 0.

When Software writes 1 to PD bit of HCR, the system at once enters HIBERNATE mode. The powers of CORE and IO are disconnected by PWRON pin, no power consumption to core and IO. When a wakeup event occurs, the core enters through a hibernate reset. Only CPM wake up logic and RTC is operating in HIBERNATE mode.

8.3.1.1 Procedure to Enter HIBERNATE mode

Before enter HIBERNATE mode, software must complete following steps:

- Finish the current operation and preserve all data to flash
- Configure the wake-up sources properly by configure HWCSR
- Set HIBERNATE MODE (Set PD bit in HCR to 1.)

8.3.1.2 Procedure to Wake-up from HIBERNATE mode

- The internal hibernate reset signal will be asserted if one of the wake-up sources is issued.
- Check RSR to determine what caused the reset
- Check PIN/ALM bits of HWCSR in order to know whether or not the power-up is caused by which wake-up from HIBERNATE mode.
- Configure the SDRAM memory controller.
- Recover the data from flash

Note:

8.4 Clock select

There could be two clock input to RTC internal clock called rtclk. One is OSC32k clock; the other is EXCLK/512.

The software MUST make sure the RTC run in valid clock configuration.

Table 8-3 Clock select registers

RTCCR.SELEXC	CPM.ERCS	Description	Valid
0	0	RTC use OSC32K clock	OK
0	1		OK
1	0	RTC use EXCLK/512 clock	OK
1	1	RTC will lost clock (Not Valid)	NO

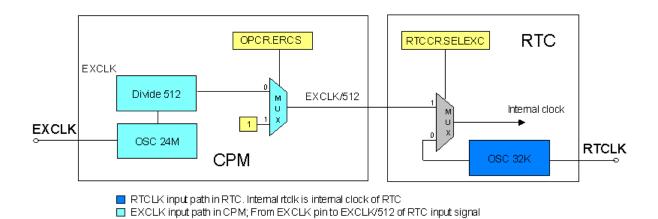

Figure 8-1 RTC clock selection path

Changing RTCLK sequence:

- 1. There are both 32KHz crystal and 24Mhz EXCLK crystal connected, so RTCLK input path has 32Khz clock.
 - In this case, there is no need to change internal clock, so do NOT change SELEXC all the time.
- 2. There is no 32KHz crystal connected but only 24Mhz EXCLK crystal connected, so RTCLK input path has no clock.

In this case, should flow the sequence below to change internal clock:

- Set OPCR.ERCS of CPM to 1; close EXCLK/512 to RTC;
- Set CLKGR.RTC of CPM to 1; close PCLK to RTC;
- 3. Set RTCCR.SELEXC to 1; change internal clock to EXCLK/512;
- 4. Wait two clock period of clock;
- 5. Clear OPCR.ERCS of CPM to 0; open EXCLK/512 to RTC;
- 6. Clear CLKGR.RTC of CPM to 0; open PCLK to RTC;
- 7. Configure all RTC registers but RTCCR.SELEXC;
- 8. Check RTCCR.SELEXC == 1;
- 9. IF YES, finish this sequence; IF NO, do step (1) again.

NOTE: If using HIBERNATE mode, MUST have both 32KHz crystal (or input 32Khz clock) and 24Mhz EXCLK crystal connected, or RTC time will be insignificant.

9 Interrupt Controller

9.1 Overview

This chapter describes the interrupt controller included in the JZ4XX Processor, explains its modes of operation, and defines its registers. The interrupt controller controls the interrupt sources available to the processor and contains the location of the interrupt source to allow software to determine source of all interrupts. It also determines whether the interrupts cause an IRQ to occur and masks the interrupts.

Features:

- Total 32 interrupt sources
- Each interrupt source can be independently enabled
- Priority mechanism to indicate highest priority interrupt
- All the registers are accessed by CPU.
- Unmasked interrupts can wake up the chip in sleep mode.

9.2 Register Description

Table 9-1 INTC Register lists the registers of Interrupt Controller. All of these registers are 32bit, and each bit of the register represents or controls one interrupt source that list in Table 9-1 INTC Register.

All INTC register 32bit access address is physical address.

Name	Description	RW	Reset Value	Address	Access Size
ICSR	Interrupt controller Source Register	R	0x00000000	0x10001000	32
ICMR	Interrupt controller Mask Register	RW	0xFFFFFFF	0x10001004	32
ICMSR	Interrupt controller Mask Set Register	W	0x????????	0x10001008	32
ICMCR	Interrupt controller Mask Clear Register	W	0x????????	0x1000100C	32
ICPR	Interrupt controller Pending Register	R	0x00000000	0x10001010	32
ICSSR	Interrupt controller Source Set Register	W	0x00000001	0x13016000	32

Table 9-1 INTC Register

9.2.1 Interrupt Controller Source Register (ICSR)

This register contains all the interrupts' status. A "1" indicates that the corresponding interrupt is pending. A "0" indicates that the interrupt is not pending now. The register is read only.

	ICS	R																											0x	100	01	000
Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Bits Of ICSR	Description
0	The corresponding interrupt source is not pending
1	The corresponding interrupt source is pending

9.2.2 Interrupt Controller Source Set Register (ICSSR)

Software can write this bit to trigger / clear an interrupt. This register can be read or write Please notice that the interrupt will continue until you set this bit to 1.

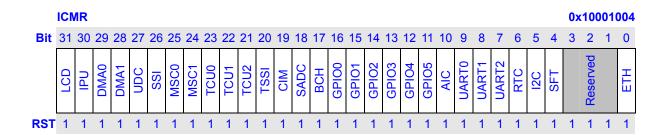

Bits Of ICSSR	Description
0	Set software interrupt
1(reset value)	Clear software interrupt

9.2.3 Interrupt Controller Mask Register (ICMR)

This register is used to mask the interrupt input sources and defines which active sources are allowed to generate interrupt requests to the processor. Its value can be changed either by writing ICMSR and ICMCR or by writing itself. The masked interrupts are invisible to the processor.

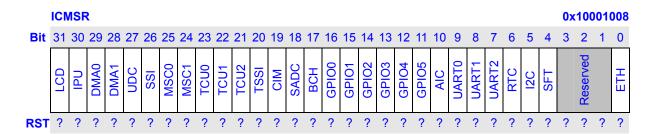

Bits Of ICMR	Description
0	The corresponding interrupt is not masked.
1	The corresponding interrupt is masked

9.2.4 Interrupt Controller Mask Set Register (ICMSR)

This register is used to set bits in the interrupt mask register. This register is write only

Bits Of ICMSR	Description
0	ignore
1	Will set the corresponding interrupt mask bit

9.2.5 Interrupt Controller Mask Clear Register (ICMCR)

This register is used to clear bits in the interrupt mask register. This register is write only.

	ICN	/ICF	2																										0x	100	010	0C
Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

RST	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?

Bits Of ICMCR	Description
0	ignore
1	Will clear the corresponding interrupt mask bit

9.2.6 Interrupt Controller Pending Register (ICPR)

This register contains the status of the interrupt sources after masking. This register is read only.

Bits Of ICPR	Description
0	The corresponding interrupt is not active or is masked
1	The corresponding interrupt is active and is not masked to the processor.

Note: Reserved bits in ICMR, ICMSR and ICMCR are normal bits to be written into and read out. Reserved bits in ICSR and ICPR are read-only and always 0.

9.3 Software Considerations

The interrupt controller is reflecting the status of interrupts sources in the peripheral .

Software should perform the task - determine the interrupt source from in ICPR. In this chip, pending interrupts have two levels in structure. Interrupting module in the system that contains more than one interrupt sources need software to determine how to service it by reading interrupt status registers within it.

In the interrupt handler, the serviced interrupt source needs to be cleared in the interrupting device. In order to make certain the cleared source request status has been reflected at the corresponding ICPR bit, software should wait enough time before exiting interrupt state.

The procedure is described following:

- 1. Interrupt generated.
- 2. CPU query interrupt sources, saves the current environment and then goes to interrupt common service routine.
- 3. Get ICPR.
- 4. Find the highest priority interrupt and vector it. (The software decides which one has the highest priority).
- 5. Mask the chosen interrupt by writing the register ICMSR.
- 6. Enable the system interrupt to allow the interrupt nesting.(software decided)
- Execute the interrupt handler and unmask it by writing the register ICMCR when exit the handler.
- 8. CPU restores the saved environment and exit the interrupt state.

Note: If you want to use software interrupt, you need to set the SFT bit of the corresponding.

10 Timer/Counter Unit

10.1 Overview

The TCU (Timer/Counter with PWM output) contains 6 channels of 16-bit programmable timers (timers 0 to 5). They can be used as Timer or PWM.

TCU has the following features:

- There are two modes of TCU for the six channels.
 - TCU1: Channel 0, 3, 4 and 5
 - TCU2: Channel 1 and 2
- Six independent channels, each consisting of
 - Counter
 - Data register (FULL and HALF)
 - Control register
- Independent clock for each counter, selectable by software
 - PCLK, EXTAL and RTCCLK can be used as the clock for counter
 - The division ratio of the clock can be set to 1, 4, 16, 64, 256 and 1024 by software
- FULL interrupt and HALF interrupt can be generated for each channel using the compare data registers
 - Timer 0-5 can be used as PWM (Set the initial signal level)
 - Timer 5 has separated interrupt.
 - Timer 0-4 has one interrupt in common.
 - OST uses interrupt 0, Timer 5 uses interrupt 1, and Timer 0-4 uses interrupt 2.
- The difference between TCU1 and TCU2:
 - TCU1: It cannot work in sleep mode, but operated easily.
 - TCU2: It can work in sleep mode, but operated more complicated than TCU1.

10.1.1 Pin Description

Table 10-1 PWM Pins Description

Name	I/O	Description
PWM [5:0]	Output	PWM channel output signals.

10.2 Register Description

In this section, we will describe the registers in timer. Following table lists all the registers definition. All timer register's 32bit address is physical address. And detailed function of each register will be described below.

Name	Description	RW	Reset Value	Address	Access Size
TSTR	Timer Status Register	R	0x00000000	0x100020F0	32
TSTSR	Timer Status Set Register	W	0x????????	0x100020F4	32

TCSR2	Timer Control Register 2	RW	0x0000	0x1000206C	16
TDFR3	Timer Data FULL Register 3	RW	0x????	0x10002070	16
TDHR3	Timer Data HALF Register 3	RW	0x????	0x10002074	16
TCNT3	Timer Counter 3	RW	0x????	0x10002078	16
TCSR3	Timer Control Register 3	RW	0x0000	0x1000207C	16
TDFR4	Timer Data FULL Register 4	RW	0x????	0x10002080	16
TDHR4	Timer Data HALF Register 4	RW	0x????	0x10002084	16
TCNT4	Timer Counter 4	RW	0x????	0x10002088	16

TCSR4	Timer Control Register 4	RW	0x0000	0x1000208C	16
TDFR5	Timer Data FULL Register 5	RW	0x????	0x10002090	16
TDHR5	Timer Data HALF Register 5	RW	0x????	0x10002094	16
TCNT5	Timer Counter 5	RW	0x????	0x10002098	16
TCSR5	Timer Control Register 5	RW	0x0000	0x1000209C	16

10.2.1 Timer Control Register (TCSR)

The TCSR is a 16-bit read/write register. It contains the control bits for each channel. It is initialized to 0x00 by any reset.

TCSR0, TCSR1, TCSR2, 0x1000204C, 0x1000205C, 0x1000206C, 0x1000207C, 0x1000208C, 0x1000209C TCSR3, TCSR4, TCSR5 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0 Bit PRESCALE W. Ш H, CLRZ SD EXT RTC 0 0 0 0 0 0 **RST**

Bits	Name		Description I											
15:11	Reserved	These bits	always re	ad 0, and	written are ignored.	R								
10	CLRZ	Clear cour	iter to 0. It	is only us	ed in TCU2 mode.	RW								
		Writing 1 to	o this bit w	ill clear th	e counter to 0. When the counter is									
		finished se	etting to 0,	it will be c	cleared by hardware.									
		Writing 0 to	riting 0 to this bit will be ignored.											
9	SD	Shut Dowr	Shut Down (SD) the PWM output. It is only used in TCU1 mode.											
		0: Gracefu	: Graceful shutdown											
		1: Abrupt s	shutdown											
		Graceful s	hutdown: 7	Γhe outpu	t level for PWM output will keep the									
		level after	vel after the comparison match of FULL.											
		Abrupt shu	brupt shutdown: The output level for PWM output will keep the level.											
8	INITL	Selects an	Selects an initial output level for PWM output.											
		1: High												
		0: Low												
7	PWM_EN	PWM outp	ut pin cont	trol bit		RW								
		1: PWM pi	n output e	nable										
		0: PWM pi	n output di	isable, an	d the PWM pin will be set to the initial									
		level accor	ding to IN	ITL.										
6	Reserved	These bits	always re	ad 0, and	written are ignored.	R

		field when	the chann	el is runni	ing									
		Bit 2	Bit1	Bit 0	Description									
		0	0	0	Internal clock: CLK/1									
		0	0	1	Internal clock: CLK/4									
		0	1	0	Internal clock: CLK/16									
		0	0 1 1 Internal clock: CLK/64											
		1	0	0	Internal clock: CLK/256									
		1	1 0 1 Internal clock: CLK/1024											

		110~111	Reserved								
2	EXT_EN	Select EXTAL as the timer cloc	elect EXTAL as the timer clock input.								
		1: Enable	Enable								
		0: Disable	Disable								
1	RTC_EN	Select RTCCLK as the timer clo	Select RTCCLK as the timer clock input.								
		1: Enable									
		0: Disable									
0	PCK_EN	Select PCLK as the timer clock	input.	RW							
		1: Enable	Enable								
		D: Disable									

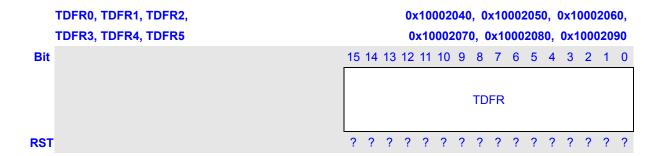

Note:

The input clock of timer and the PCLK should keep to the rules as follows:

Input clock of timer: IN_CLK	Clock generated from the frequency divider
	(PRESCALE): DIV_CLK
PCK_EN == 0, RTC_EN == 1 and EXT_EN == 0	$f_{DIV_CLK} < \frac{1}{2} f_{PCLK}$
(IN_CLK = RTCCLK)	
PCK_EN == 0, RTC_EN == 0 and EXT_EN == 1	f _{DIV_CLK} < ½ f _{PCLK}
(IN_CLK = EXTAL)	
PCK_EN == 1, RTC_EN == 0 and EXT_EN == 0	ANY
(IN_CLK = PCLK)	

10.2.2 Timer Data FULL Register (TDFR)

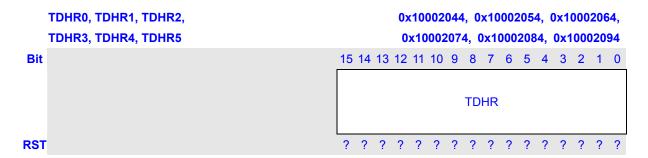

The comparison data FULL registers TDFR is used to store the data to be compared with the content of the up-counter TCNT. This register can be directly read and written. (Default: indeterminate) But it is not suggested changing when counter is working in TCU2 mode.

10.2.3 Timer Data HALF Register (TDHR)

The comparison data HALF registers TDHR is used to store the data to be compared with the content of the up-counter TCNT. This register can be directly read and written. (Default: indeterminate) But it is not suggested changing when counter is working in TCU2 mode.

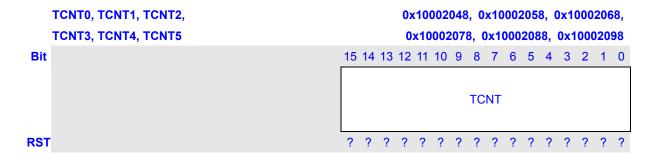

10.2.4 Timer Counter (TCNT)

TCNT is a 16-bit read/write register. The up-counter TCNT can be reset to 0 by software and counts up using the prescaler output clock. When TCNT count up to equal to TDFR, it will reset to 0 and continue to count up.

TCU1: The counter data can be read out at any time. The data can be written at any time. This makes it possible to change the interrupt and/or clock output cycles temporarily. (Default: indeterminate)

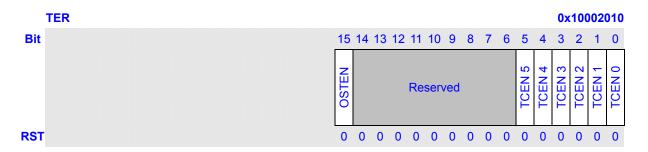

TCU2: The counter data can be read out at any time, but you should read TSTR.REALn to check whether the data is real data or not. The data can only be written before counter is started, and the counter clock is pclk. But it can be cleared to 0 by setting TCSR.CLRZ to 1, and if the counter is really cleared, TCSR.CLRZ will be set to 0 by hardware.

10.2.5 Timer Counter Enable Register (TER)

The TER is a 16-bit read-only register. It contains the counter enable control bits for each channel. It is initialized to 0x0000 by any reset. It can only be set by register TESR and TECR. Since the timer enable control bits are located in the same addresses, two or more timers can be started at the same time.

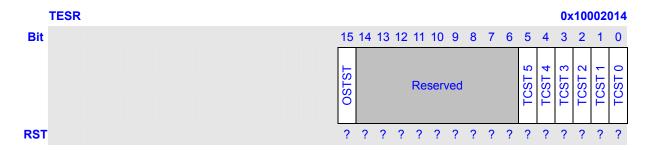

Bits	Name	Description	RW
15	OSTEN	Enable the counter in OST.	
		1: Begin counting up	
		0: Stop counting up	
14:6	Reserved	These bits always read 0, and written are ignored.	R
5	TCEN 5	Enable the counter in timer 5.	R
		1: Begin counting up	
		0: Stop counting up	
4	TCEN 4	Enable the counter in timer 4.	R
		1: Begin counting up	
		0: Stop counting up	
3	TCEN 3	Enable the counter in timer 3.	R
		1: Begin counting up	
		0: Stop counting up	
2	TCEN 2	Enable the counter in timer 2.	R
		1: Begin counting up	
		0: Stop counting up	
1	TCEN 1	Enable the counter in timer 1.	R
		1: Begin counting up	
		0: Stop counting up	
0	TCEN 0	Enable the counter in timer 0.	R
		1: Begin counting up	
		0: Stop counting up	

10.2.6 Timer Counter Enable Set Register (TESR)

The TCCSR is a 32-bit write-only register. It contains the counter enable set bits for each channel. Since the timer enable control set bits are located in the same addresses, two or more timers can be started at the same time.

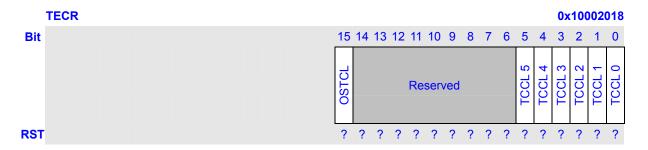

Bits	Name	Description	RW
15	OSTST	Set OSTEN bit of TER.	W
		1: Set OSTEN bit to 1	
		0: Ignore	
14:6	Reserved	These bits always read 0, and written are ignored.	W
5	TCST 5	Set TCEN 5 bit of TER.	W
		1: Set TCEN 5 bit to 1	
		0: Ignore

		1: Set TCEN 4 bit to 1	
		0: Ignore	
3	TCST 3	Set TCEN 3 bit of TER.	W
		1: Set TCEN 3 bit to 1	
		0: Ignore	
2	TCST 2	Set TCEN 2 bit of TER.	W
		1: Set TCEN 2 bit to 1	
		0: Ignore	
1	TCST 1	Set TCEN 1 bit of TER.	W
		1: Set TCEN 1 bit to 1	
		0: Ignore	
0	TCST 0	Set TCEN 0 bit of TER.	W
		1: Set TCEN 0 bit to 1	
		0: Ignore	

10.2.7 Timer Counter Enable Clear Register (TECR)

The TECR is a 32-bit write-only register. It contains the counter enable clear bits for each channel. Since the timer enable clear bits are located in the same addresses, two or more timers can be stop at the same time.

Bits	Name	Description	RW
15	OSTCL	Set OSTEN bit of TER.	W
		1: Set OSTEN 5 bit to 0	
		0: Ignore	
14:6	Reserved	These bits always read 0, and written are ignored.	W
5	TCCL 5	Set TCEN 5 bit of TER.	W
		1: Set TCEN 5 bit to 0	
		0: Ignore	
4	TCCL 4	Set TCEN 4 bit of TER.	W
		1: Set TCEN 4 bit to 0	
		0: Ignore	
3	TCCL 3	Set TCEN 3 bit of TER.	W
		1: Set TCEN 3 bit to 0	
		0: Ignore	
2	TCCL 2	Set TCEN 2 bit of TER.	W
		1: Set TCEN 2 bit to 0	
		0: Ignore	
1	TCCL 1	Set TCEN 1 bit of TER.	W
		1: Set TCEN 1 bit to 0	
		0: Ignore	
0	TCCL 0	Set TCEN 0 bit of TER.	W
		1: Set TCEN 0 bit to 0	
		0: Ignore	

10.2.8 Timer Flag Register (TFR)

The TFR is a 32-bit read-only register. It contains the comparison match flag bits for all the channels. It can also be set by register TFSR and TFCR. It is initialized to 0x00000000 by any reset.

	TFF	₹																											0x1	000	202	20

		0: Ignore	
0	Reserved	These bits always read 0, and written are ignored.	R

10.3 Operation

10.3.1 Basic Operation in TCU1 Mode

The value of TDFR should be bigger than TDHR, and the minimum settings are TDHR = 0 and TDFR = 1. In this case, the timer output clock cycle is the input clock × 1/2. If TDHR > TDFR, no comparison TFHR signal is generated.

Before the timer counter begin to count up, we need to do as follows:

If you want to use PWM you should set TCSR.PWM_EN to be 0 before you initial TCU.

- Initial the configuration.
- Writing TCSR.INITL to initialize PWM output level.
- Writing TCSR.SD to setting the shutdown mode (Abrupt shutdown or Graceful shutdown).
- Writing TCSR.PRESCALE to set TCNT count clock frequency.
- Setting TCNT, TDHR and TDFR.

- Enable the clock.
- Writing TCSR.PWM EN to set whether enable PWM or disable PWM.
- Writing TCSR.EXT_EN, TCSR.RTC_EN or TCSR.PCK_EN to 1 to select the input clock and enable the input clock. Only one of TCSR.EXT_EN, TCSR.RTC_EN and TCSR.PCK_EN can be set to 1.

After initialize the register of timer, we should start the counter as follows:

Enable the counterSetting the TESR.TCST bit to 1 to enable the TCNT.

Note: The input clock and PCLK should follows the rules advanced before.

10.3.2 Disable and Shutdown Operation in TCU1 Mode

1. Setting the TECR.TCCL bit to 1 to disable the TCNT.

10.3.3 Basic Operation in TCU2 Mode

The value of TDFR should be bigger than TDHR, and the minimum settings are TDHR = 0 and TDFR = 1. In this case, the timer output clock cycle is the input clock \times 1/2. If TDHR > TDFR, no comparison TFHR signal is generated.

Initial state is that TCSR.PRESCALE=0, TCSR.PWM EN=0 and TCENR=0.

- Reset the TCU.
 - a) Writing TCSR.PCK EN to 1 to select pclk as the input clock.
 - b) Set TCSR.CLRZ to 1 to clear TCNT or set TCNT to an initial value.
 - c) Writing TCSR.PCK_EN to 0 to close the input clock.
- 2. Initial the configuration.
 - Setting TDHR and TDFR.
 - Writing TCSR.INITL to initialize PWM output level (if used PWM).
 - Writing TCSR.PRESCALE to set TCNT count clock frequency.
 - d) Writing TCSR.EXT_EN, TCSR.RTC_EN or TCSR.PCK_EN to 1 to select the input clock and enable the input clock. Only one of TCSR.EXT_EN, TCSR.RTC_EN and TCSR.PCK EN can be set to 1.
 - Writing TCSR.PWM_EN to set whether enable PWM or disable PWM.

After initialize the register of timer, we should start the counter as follows:

2. Setting the TESR.TCST bit to 1 to enable the TCNT.

Note:

You can clear the counter when counter is working.

- a) Set TCSR.CLRZ to 1 to clear TCNT.
- b) Wait till TSTR.BUSY = 0, that is the counter have been cleared.

You can enable PWM or disable PWM the counter when counter is working.

- c) Set TCSR.PWM EN to 1 to enable PWM.
- d) Set TCSR.PWM EN to 0 to disable PWM.

10.3.4 Disable and Shutdown Operation in TCU2 Mode

- 1. Writing TCSR.PWM_EN to 0 to disable PWM.
- 2. Setting the TECR.TCCL bit to 1 to disable the TCNT.
- 3. Wait till TSTR.BUSY = 0, that is the reset of counter is finished.

10.3.5 Read Counter in TCU2 Mode

If you want to read the data from register TCNT when the TCU is working, you can check TSTR.REAL whether it is good or not. It is suggested that:

- (1) If TSTR.REAL==1, the data read is available.
- (2) If TSTR.REAL==0, reread the counter till TSTR.REAL==1, the data read is available.
- If TSTR.REAL is always 0, you can read some data, and lose some data that is quick different from the others. Then choose a data from them as the available data.

Note:

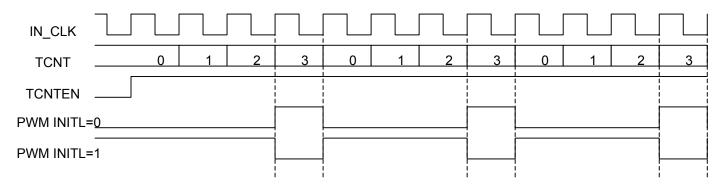

It suggested that (1), (2) is often used when the counter clock is very slow.

It suggested that (3) is often used when the counter clock is very fast.

10.3.6 Pulse Width Modulator (PWM)

Timer 0~5 can be used as Pulse Width Modulator (PWM). The PWM can be used to control the back light inverter or adjust bright or contrast of LCD panel.

FULL comparison match signal and HALF comparison match signal can determine an attribute of the PWM_OUT waveform. FULL comparison match signal specifies the clock cycle for the PWM module clock. HALF comparison match signal specifies the duty ratio for the PWM module clock.

11 Operating System Timer

11.1 Overview

The OST (Operating System Timer) contains one 32-bit programmable timer. It can be used ad operating system timer.

OST has the following features:

- OST includes:
 - 32-bit Counter
 - 32-bit Compare Data Register
 - Control Register
- Independent clock for each counter, selectable by software
 - PCLK, EXTAL and RTCCLK can be used as the clock for counter
 - The division ratio of the clock can be set to 1, 4, 16, 64, 256 and 1024 by software
- Match interrupt can be generated for OST using the compare data registers
 - Interrupt flag and interrupt mask is same with TCU in TCU spec.

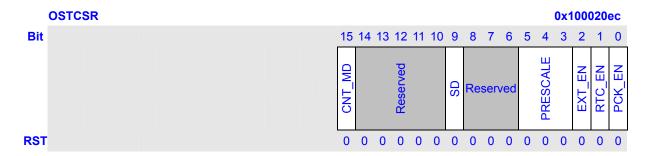

11.2 Register Description

In this section, we will describe the registers in OST. Following table lists all the registers definition. All OST register's 32bit address is physical address. And detailed function of each register will be described below.

Name	Description	RW	Reset Value	Address	Access
					Size
OSTDR	Operating System Timer Data Register	RW	0x????????	0x100020e0	32
OSTCNT	Operating System Timer Counter	RW	0x????????	0x100020e8	32
OSTCSR	Operating System Timer Control Register	RW	0x0000	0x100020ec	16

11.2.1 Operating System Control Register (OSTCSR)

The TCSR is a 16-bit read/write register. It contains the control bits for OST. It is initialized to 0x00 by any reset.

Bits	Name	Description Counter mode choose bit.											
15	CNT_MD	Counter m	ode choos	e bit.									
		0: When th	ne value co	ounter is e	equal to compare value, the counter will								
		be cleared	, and incre	ease from	0.								
		1: When th	ne value co	ounter is e	equal to compare value, the counter will								
		go on incre	easing till o	overflow, a	and then increase from 0.								
14:6	Reserved	These bits	ese bits always read 0, and written are ignored. ut Down (SD) the PWM output. It is only used in TCU1 mode.										
9	SD	Shut Dowr	nut Down (SD) the PWM output. It is only used in TCU1 mode.										
		0: Gracefu	Graceful shutdown (only used when CNT_MD = 0)										
		1: Abrupt s	shutdown										
5:3	PRESCALE	These bits	select the	TCNT co	ount clock frequency.	RW							
		Bit 2	Bit1	Bit 0	Description								
		0	0	0	Internal clock: CLK/1								
		0	0 0 1 Internal clock: CLK/4										
		0	1	0	Internal clock: CLK/16								
		0	1	1	Internal clock: CLK/64								
		1	1 0 0 Internal clock: CLK/256										

		1	0	1	Internal clock: CLK/1024							
		110~111			Reserved							
2	EXT_EN	Select EXT	AL as the	timer cloc	k input.	RW						
		1: Enable	able									
		0: Disable	isable									
1	RTC_EN	Select RT0	ect RTCCLK as the timer clock input.									
		1: Enable										
		0: Disable										
0	PCK_EN	Select PCL	elect PCLK as the timer clock input.									
		1: Enable										
		0: Disable	: Disable									

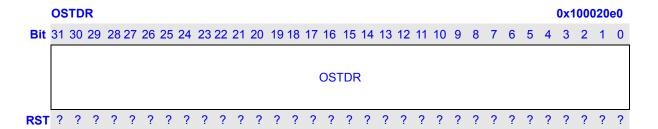

Note:

The input clock of timer and the PCLK should keep to the rules as follows:

Input clock of timer: IN_CLK	Clock generated from the frequency divider (PRESCALE): DIV_CLK
PCK_EN == 0, RTC_EN == 1 and EXT_EN == 0 (IN_CLK = RTCCLK)	$f_{DIV_CLK} < \frac{1}{2} f_{PCLK}$
PCK_EN == 0, RTC_EN == 0 and EXT_EN == 1 (IN_CLK = EXTAL)	$f_{\text{DIV_CLK}} < \frac{1}{2} f_{\text{PCLK}}$
PCK_EN == 1, RTC_EN == 0 and EXT_EN == 0 (IN_CLK = PCLK)	ANY

11.2.2 Operating System Timer Data Register (OSTDR)

The operating system timer data register OSTDR is used to store the data to be compared with the content of the operating system timer up-counter OSTCNT. This register can be directly read and written. (Default: indeterminate)

11.2.3 Operating System Timer Counter (OSTCNT)

The operating system timer counter (OSTCNT) is a 32-bit read/write counter. The up-counter OSTCNT can be set by software and counts up using the prescaler output clock. The data can be read out at any time. The counter data can be written at any time. (Default: indeterminate)

	OSTCNT																0x100020e8															
Bit	31	30	29	28 2	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	OSTCNT																															
RST	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?

11.3 Operation

11.3.1 Basic Operation

Before the timer counter begin to count up, we need to do as follows:

- 1. Initial the configuration.
 - Writing TCSR.SD to setting the shutdown mode (Abrupt shutdown or Graceful shutdown).
 - Writing OSTCSR.PRESCALE to set OSTCNT count clock frequency.
 - Setting OSTCNT and OSTDR.
- Enable the clock.

Writing OSTCSR.EXT_EN, OSTCSR.RTC_EN or OSTCSR.PCK_EN to 1 to select the input clock and enable the input clock. Only one of OSTCSR.EXT_EN, OSTCSR.RTC_EN and OSTCSR.PCK_EN can be set to 1.

After initialize the register of timer, we should start the counter as follows:

Enable the counter Setting the TESR.OSTCST bit to 1 to enable the OSTCNT.

Note: The input clock and PCLK should follows the rules advanced before.

11.3.2 Disable and Shutdown Operation

Setting the TECR.OSTCCL bit to 1 to disable the OSTCNT.

12 Watchdog Timer

12.1 Overview

The watchdog timer is used to resume the processor whenever it is disturbed by malfunctions such as noise and system errors. The watchdog timer can generate the reset signal.

Features:

- Generates WDT reset.
- A 16-bit Data register and a 16-bit counter.
- Counter clock uses the input clock selected by software.
 - PCLK, EXTAL and RTCCLK can be used as the clock for counter
 - The division ratio of the clock can be set to 1, 4, 16, 64, 256 and 1024 by software

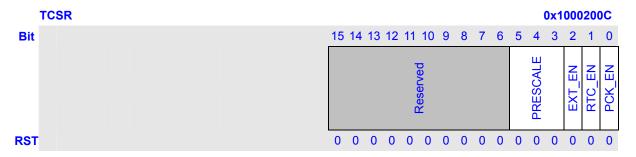

12.2 Register Description

In this section, we will describe the registers in WDT. Following table lists all the registers definition. All WDT register's 32bit address is physical address. And detailed function of each register will be described below.

Name	Description		Reset Value	Address	Access
					Size
TDR	Watchdog Timer Data Register	RW	0x????	0x10002000	16
TCER	Watchdog Counter Enable Register	RW	0x00	0x10002004	8
TCNT	Watchdog Timer Counter	RW	0x????	0x10002008	16
TCSR	Watchdog Timer Control Register	RW	0x0000	0x1000200C	16

12.2.1 Watchdog Control Register (TCSR)

The TCSR is a 16-bit read/write register. It contains the control bits for WDT. It is initialized to 0x00 by any reset.

Bits	Name	Description					
15:6	Reserved	These bits always read 0, and written are ignored.				R	
5:3	PRESCALE	These b	These bits select the TCNT count clock frequency.			RW	
		Bit 2	Bit1	Bit 0	Description		
		0	0	0	Internal clock: CLK/1		
		0	0	1	Internal clock: CLK/4		
		0	1	0	Internal clock: CLK/16		
		0	1	1	Internal clock: CLK/64		
		1	0	0	Internal clock: CLK/256		
		1	0	1	Internal clock: CLK/1024		
		110~1	11		Reserved		
2	EXT_EN	Select E	XTAL as th	e timer clo	ock input.	RW	
		1: Enabl	е				
		0: Disab	0: Disable				
1	RTC_EN	Select R	Select RTCCLK as the timer clock input.				
		1: Enabl	е				

		0: Disable	
0	PCK_EN	Select PCLK as the timer clock input.	RW
		1: Enable	
		0: Disable	

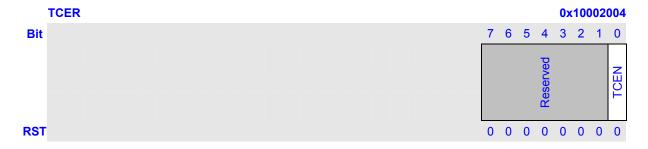

Note:

The input clock of timer and the PCLK should keep to the rules as follows:

Input clock of timer: IN_CLK	Clock generated from the frequency divider (PRESCALE): DIV_CLK
PCK_EN == 0, RTC_EN == 1 and EXT_EN == 0	$f_{DIV_CLK} < \frac{1}{2} f_{PCLK}$
(IN_CLK = RTCCLK)	
PCK_EN == 0, RTC_EN == 0 and EXT_EN == 1	f _{DIV_CLK} < ½ f _{PCLK}
(IN_CLK = EXTAL)	
PCK_EN == 1, RTC_EN == 0 and EXT_EN == 0	ANY
(IN_CLK = PCLK)	

12.2.2 Watchdog Enable Register (TCER)

The TCER is an 8-bit read/write register. It contains the counter enable control bits for watchdog. It is initialized to 0x00 by any reset.

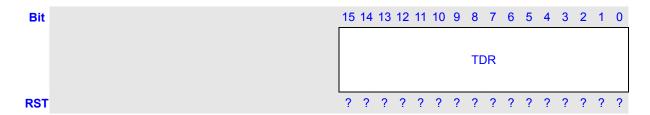

Bits	Name	Description				
7:1	Reserved	These bits always read 0, and written are ignored.	R			
0	TCEN	Counter enable control.	RW			
		0: Timer stop.				
		1: Timer running.				

12.2.3 Watchdog Timer Data Register (TDR)

The watchdog timer data register TDR is used to store the data to be compared with the content of the watchdog timer up-counter TCNT. This register can be directly read and written. (Default: indeterminate)

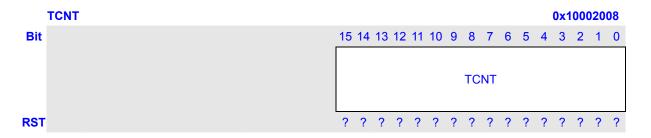

TDR 0x10002000

12.2.4 Watchdog Timer Counter (TCNT)

The watchdog timer counter (TCNT) is a 16-bit read/write counter. The up-counter TCNT can be reset to 0 by software and counts up using the prescaler output clock. When TCNT count up to equal to TDR, the comparison match signal will be generated and a WDT reset is generated. The data can be read out at any time. The counter data can be written at any time. (Default: indeterminate)

12.3 Watchdog Timer Function

The following describes steps of using WDT:

- 1. Setting the PRESCALE of input clock in register TCSR.
- 2. Set register TDR and TCNT.
- 3. Select the input clock and enable the input clock in register TCSR.

After initialize the register of timer, we should start the counter as follows:

- 4. Set TCEN bit in TCER to 1. The counter TCNT begins to count.
- 5. If TCNT = TDR, a WDT reset will be generated.

Note1: The input clock and PCLK should follows the rules advanced before.

Note2: The clock of WDT can be stopped by setting register TSR, and register TSR can only be set by register TSSR or TSCR. The content of register TSR, TSSR and TSCR can be found in TCU spec.

General-Purpose I/O Ports 13

13.1 Overview

General Purpose I/O Ports (GPIO) is used in generating and capturing application-specific input and output signals. Each port can be programmed as an output, an input or function port that serves certain peripheral. As input, pull up/down can be enabled/disabled for the port and the port also can be configured as level or edge tripped interrupt source.

Features:

- Each port can be configured as an input, an output or an alternate function port.
- Each port can be configured as an interrupt source of low/high level or rising/falling edge triggering. Every interrupt source can be masked independently.
- Each port has an internal pull-up or pull-down resistor connected. The pull-up/down resistor can be disabled.

The GPIO ports, named PA00~31, PB00~31, PC00~31, PD00~31, PE00~31 and PF00~23 are divided into 6 GPIO groups with maximum of 32 GPIO in each group. Group A includes PA00~PA31. Group B includes PB00~31; Group D includes PD00~PD31; Group E includes PE00~ PE31 (except PE14~PE17, PE21, PE26, PE27); Group F include PF10~PF15. GPIO output 6 interrupts, 1 for every group, to INTC.

For every group, 23 memory-mapped 32-bit registers can be used to operate the GPIO ports:

PAPIN, PBPIN, PCPIN, PDPIN, PEPIN, PFPIN

PADAT, PBDAT, PCDAT, PDDAT, PEDAT, PFDAT

Table 13-6 GPIO Port F summary

Bit	PF	Pull		Shared Function Port Selected by					
N	N	(U/D)	Bypass	PFUN = 1	PFUN = 1	Note			
			Mode	PTRG = 0	PTRG = 0				
				PSEL = 0	PSEL = 1				
10	10	U	-	SSI_CLK (out)	-				
11	11	U	-	SSI_DT (out)	PWM1 (out)				
12	12	U	-	SSI_DR (in)	-				
13	13	U	-	SSI_CE0_ (out)	-				
14	14	U	-	SSI_GPC (out)	-				
15	15	U	-	SSI_CE2_ (out)	-				

Note:

- 1. PB24: GPIO group B bit 24 is reset to CKO function.
- 2. PC27: GPIO group C bit 27.
 - a) If NAND flash is used, it should connect to NAND FRB. (NAND flash ready/busy)
 - b) If NAND flash is not used, it is used as general GPIO.
- 3. PC30: GPIO group C bit 30 is used as BOOT_SEL0 input during boot.
- 4. PC31: GPIO group C bit 31 is used as BOOT SEL1 input during boot.
- 5. PE29: GPIO group E bit 29 is used as BOOT_SEL2 input during boot.
- 6. BOOT_SEL2, BOOT_SEL1, BOOT_SEL0 are used to select boot source and function during the processor boot.
- 7. PE30: GPIO group E bit 30 can only be used as input and interrupt, no pull-up and pull-down.
- 8. PE31: GPIO group E bit 31. No corresponding pin exists for this GPIO. It is only used to select the function between UART and JTAG, which share the same set of pins, by using register PCSEL [31]
 - When PESEL [31]=0, select JTAG function.
 - When PESEL [31]=1, select UART function
- 9. This GPIO pin is not available in Jz4755 chip

13.2 Register Description

Table 13-2 summarized all memory-mapped registers, which can be programmed to operate GPIO port and alternate function port sharing configuration.

All registers are in 32-bits width. Usually, 1 bit in the register affects a corresponding GPIO port and every GPIO port can be operated independently.

Table 13-2 GPIO Registers

Name	Description	RW	Reset Value	Address	Size
	GPIO PO	RT A

Bits	Name	Description	R/W
n	PINL n	Where n = 0 ~ 31 and PINL n = PINL0 ~ PINL31.	R
		The PORT PIN level can be read by reading PINL n bit in register PXPIN.	

PAPIN bits 31-0 correspond to PA31-0; PBPIN to PB31-0; PCPIN to PC31-0; PDPIN to PD31-0; PEPIN to PE31-0 and PFPIN to PF 31-0.

13.2.2 PORT Data Register (PADAT, PBDAT, PCDAT, PDDAT, PEDAT, PFDAT)

PADAT, PBDAT, PDDAT, PDDAT and PFDAT are six 32-bit PORT DATA registers. They are read-only registers.

Bits	Name	Description	R/W
N	DATA n	Where n = 0 ~ 31 and DATA n = DATA0 ~ DATA31.	R
		The register is used as GPIO data register.	
		When GPIO is used as interrupt the register is no used.	

PADAT bits 31-0 correspond to PA31-0; PBDAT to PB31-0; PCDAT to PC31-0; PDDAT to PD31-0; PEDAT to PE31-0 and PEDAT to PE 31-0.

13.2.3 PORT Data Set Register (PADATS, PBDATS, PCDATS, PDDATS, PEDATS, PFDATS)

PADATS, PBDATS, PCDATS, PDDATS, PEDATS and PFDATS are six 32-bit PORT DATA set registers. They are write-only registers.

Bits	Name	Description	R/W
n	MASK n	Where n = 0 ~ 31 and MASK n = MASK0 ~ MASK31.	R
		MASK n is used for mask the interrupt of GPIO n.	
		0: Enable the pin as an interrupt source.	
		1: Disable the pin as an interrupt source.	

PAIM bits 31-0 correspond to PA31-0; PBIM to PB31-0; PCIM to PC31-0; PDIM to PD31-0; PEIM to PE31-0 and PFIM to PF 31-0.

13.2.6 PORT Mask Set Register (PAIMS, PBIMS, PCIMS, PDIMS, PEIMS, PFIMS)

PAIMS, PBIMS, PCIMS, PDIMS, PEIMS and PFIMS are six 32-bit PORT MASK set registers. They are write-only registers.

	PAI	MS	, PE	3IM	S, I	PCI	MS	,													0x1	001	100	24,	0x1	00	101	24,	0x1	100	102	24,

Bits	Name	Description	R/W
N	PULL n	Where n = 0 ~ 31 and PULL n = PULL0 ~ PULL31.	R
		PULL n is used for setting the port to be PULL UP or PULL DOWN	
		enable.	
		1: No pull up or pull down resistor connects to the port.	
		0: An internal pull up or pull down resistor connects to the port. Up or	
		down is pin dependence. Please reference to Table 13-1 ~ Table 13-4 for	
		it.	

PAPE bits 31-0 correspond to PA31-0; PBPE to PB31-0; PCPE to PC31-0; PDPE to PD31-0; PEPE to PE31-0 and PFPE to PF 31-0.

13.2.9 PORT PULL Set Register (PAPES, PBPES, PCPES, PDPES, PEPES, PFPES)

PAPES, PBPES, PCPES, PDPES, PEPES and PFPES are six 32-bit PORT PULL set registers. They are write-only registers.

Bits	Name	Description	R/W
n	FLAGC n	When GPIO is used as interrupt function and when write 1 to the bit, the	R
		bit FLAG n in PXFLG will be cleared.	

PAFLGC bits 31-0 correspond to PA31-0; PBFLGC to PB31-0; PCFLGC to PC31-0; PDFLGC to PD31-0; PEFLGC to PE31-0 and PFFLGC to PF 31-0.

13.3 Program Guide

13.3.1 GPIO Function Guide

- 1. Set PXFUN to choose the function of GPIO / Interrupt by writing 1 to register PXFUNC.
- 2. Set PXSEL to choose the function of GPIO by writing 1 to register PXSELC.
- 3. Set PXDIR to choose the direction of GPIO by writing 1 to register PXDIRS or PXDIRC.
- 4. Others.
 - a) You can read the PORT PIN level by reading register PXPIN.
 - b) You can use register PXDAT as normal data register. The register can be set by register PXDATS and PXDATC.
 - c) You can set PXPE by writing 1 to register PXPES or PXPE to use Internal pull-up/down resistor or not.

13.3.2 Alternate Function Guide

- 1. Set PXFUN to 0 by writing 1 to register PXFUNC. (Ready state)
- 2. Set PXTRG to choose the alternate function group 0 by writing 1 to register PXTRGC. Set PXTRG to choose the alternate function group 1 by writing 1 to register PXTRGS.
- Set PXSEL to choose the alternate function 0 by writing 1 to register PXSELC.Set PXSEL to choose the alternate function 1 by writing 1 to register PXSELS.
- 4. Set PXFUN to choose the function of alternate function by writing 1 to register PXFUNS.

13.3.3 Interrupt Function Guide

First you should keep GPIO status.

- 1. Set PXIM by writing 1 to register PXIMS.
- 2. Set PXTRG to choose the interrupt trigger mode by writing 1 to register PXTRGS or PXTRGC.
- 3. Set PXFUN to choose the function of GPIO / Interrupt by writing 1 to register or PXFUNC.
- 4. Set PXSEL to choose the Interrupt function by writing 1 to register PXSELS.
- 5. Set PXDIR to choose the direction of interrupt trigger by writing 1 to register PXDIRS or PXDIRC.
- 6. Set the PXFLGC register to clear the interrupt flag.
- 7. Clear PXIM by writing 1 to register PXIMC to enable the GPIO interrupt.
- 8. Others.

You should check the level interrupt whether to happen as follows:

 a) When the PIN level read from register PXPIN is the same with what you have set in register PXTRG and PXDIR, then the level interrupt happened.

b) When the PIN level read from register PXPIN is different from what you have set in register PXTRG and PXDIR, then the level interrupt did not happen.

13.3.4 Disable Interrupt Function Guide

- 1. Set PXIM by writing 1 to register PXIMS.
- 2. Set PXTRG to 0 by writing 1 to register PXTRGC.
- 3. Set PXDIR to 0 by writing 1 to register PXDIRC.
- 4. Set PXFUN to 0 by writing 1 to register or PXFUNC.
- 5. Set PXSEL to 0 by writing 1 to register PXSELC.

14 LCD Controller

14.1 Overview

The JZ integrated LCD controller has the capabilities to driving the latest industry standard STN and TFT LCD panels. It also supports some special TFT panels used in consuming electronic products. The controller performs the basic memory based frame buffer and palette buffer to LCD panel data transfer through use of a dedicated DMA controller. Temporal dithering (frame rate modulation) is supported for STN LCD panels. And OSD is also supported for LCD controller.

Features:

(1) Basic Features:

- Support PAL/NTSC TV out. 3-components (YUV) TV out (refer TVE spec). VGA
- Support CCIR601/656 data format.
- Single and Dual panel displays in STN mode.
- Single panel displays in TFT mode.
- Display size up to 1024x576.
- Internal palette RAM 256x16 bits.

(2) Colors Supports:

- Encoded pixel data of 1, 2, 4, 8 or 16 BPP in STN mode.
- Support 2, 4, 16 grayscales and up to 4096 colors in STN mode.
- Encoded pixel data of 1, 2, 4, 8, 16, 18 or 24 BPP in TFT mode.
- Support 65,536(65K), 262,144(260K) and up to 16,777,216 (16M) colors in TFT mode.

(3) Panel Supports:

- Support single STN panel and dual STN panel with 1, 2, 4, 8 data output pins.
- Support 16-bit parallel TFT panel.
- Support 18-bit parallel TFT panel.
- Support 24-bit serial TFT panel with 8 data output pins.
- Support 24-bit parallel TFT panel.
- Support Delta RGB panel.

(4) OSD Supports:

- Supports one single color background.
- Supports two foregrounds, and every size can be set for each foreground.
- Supports one transparency for the whole graphic.
- Supports one transparency for each pixel in one graphic.
- Supports color key and mask color key.

14.2 Pin Description

Table 14-1 LCD Controller Pins Description

Name	I/O	Description
Lcd_pclk	Input/Output	Display device pixel clock
Lcd_vsync	Input/Output	Display device vertical synchronize pulse
Lcd_hsync	Input/Output	Display device horizontal synchronize pulse
Lcd_de	Output	Display device is STN: AC BIAS Pin
		Display device is NOT STN: data enable Pin
Lcd_d[17:0]	Output	Display device data pins
lcd_lo6_o[5:0]	Output	Display device data pins use in 24 bit parallel mode.
Lcd_spl*1	Output	Programmable special pin for generating control signals
Lcd_cls*1	Output	Programmable special pin for generating control signals
Lcd_ps*1	Output	Programmable special pin for generating control signals
Lcd_rev*1	Output	Programmable special pin for generating control signals

Note1:

The mode and timing of special pin Lcd_spl, Lcd_cls, Lcd_ps and Lcd_rev can be seen in **part 1.7** LCD Controller Pin Mapping.

14.3 Block Diagram

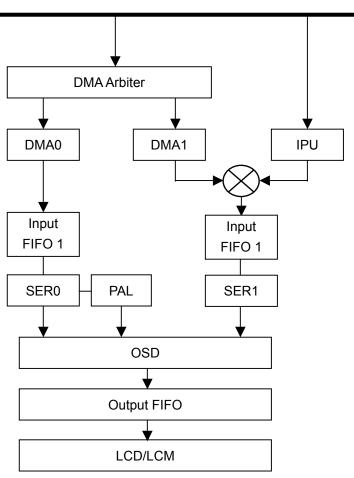

Figure 14-1 Block Diagram when use OSD mode

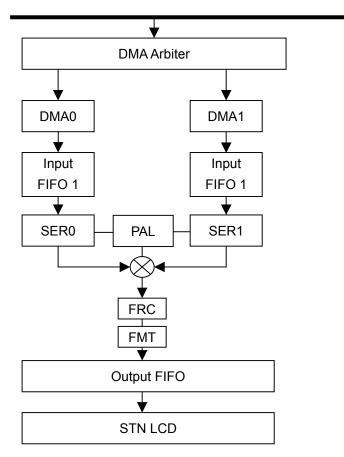

Figure 14-2 Block Diagram of STN mode (not use OSD)

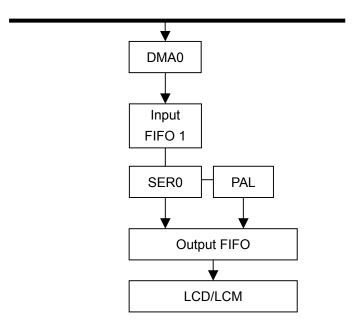

Figure 14-3 Block Diagram of TFT mode (not use OSD)

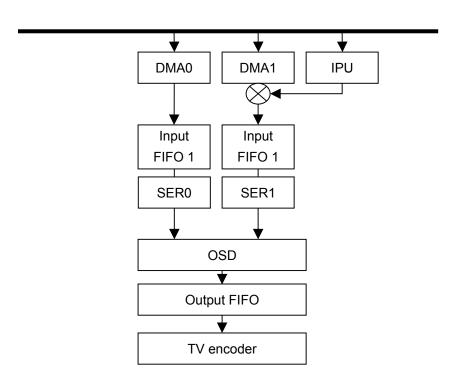

Figure 14-4 Block Diagram of TV interface

14.4 LCD Display Timing

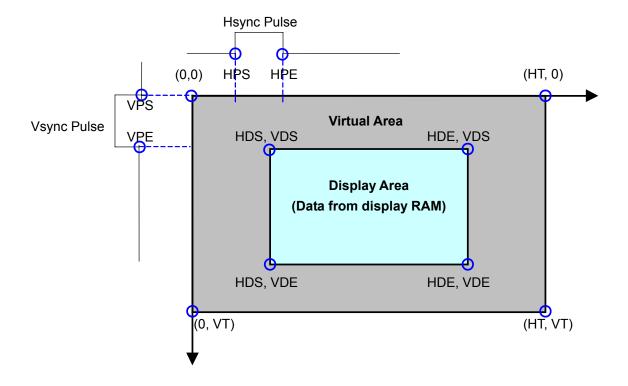

Figure 14-2 Display Parameters

Note1:

VPS === 0

VSYNC pulse always start at point (0,0)

Note2:

H: Horizontal V: Vertical T: Total

D: Display Area P: Pulse S: Start point E: End point

In the (H, V) Coordinates:

- 1. The gray rectangle (0, 0) to (HT, VT) is "Virtual Area";
- 2. The blue rectangle (HDS, VDS) to (HDE, VDE) is "Display Area";
- 3. VPS, VPE defines the VSYNC signal timing; (VPS always be zero)
- 4. HPS, HPE defines the HSYNC signal timing;

All timing parameters start with "H" is measured in lcd_pclk ticks.

All timing parameters start with "V" is measured in lcd_hsync ticks.

This diagram describes the general LCD panel parameters, these can be set via the registers that describes in next section.

14.5 TV Encoder Timing

Some of Video Encoders for TV (Tele Vision) require interlaced timing interface.

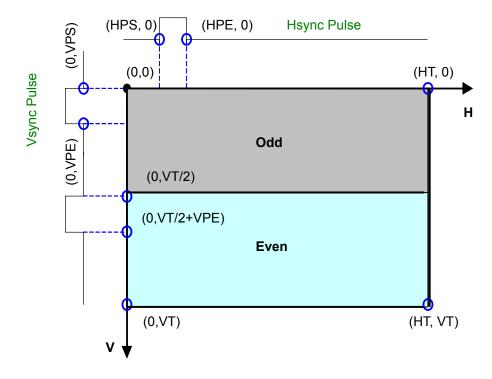

Figure 14-2 TV-Encoder Display Parameters

Note1:

Even Field contains one more blank line.

e.g. For standard PAL timing, Odd filed has 312 lines while even field has 313 lines.

Note2:

Interlace mode generate 2 vsync pulse for each field. The second vsync start at (VT/2), end at (VT/2 + VPE)

Note3:

Display Area & Virtual Area has the same size. VDS=HDS=0, VDE=VT, HDE=HT

14.6 OSD Graphic

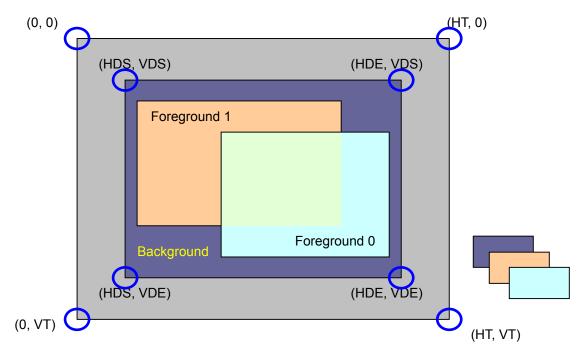

Figure 14-3 OSD Graphic

Note1:

Background is one single color and the size is the full screen.

Note2:

The size of foregrounds can be every size smaller than background.

Note3:

The order of the graphic is as follows:

(1) Top layer: Foreground 0(2) Middle layer: Foreground 1(3) Bottom layer: Background

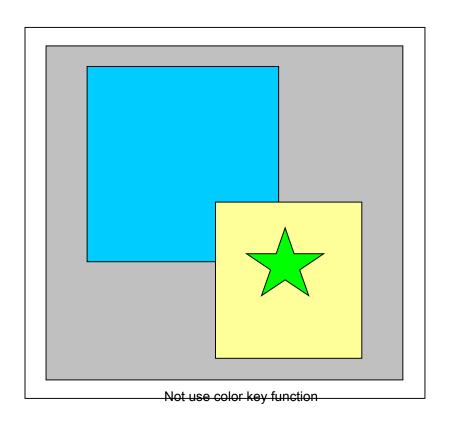

14.6.1 Color Key

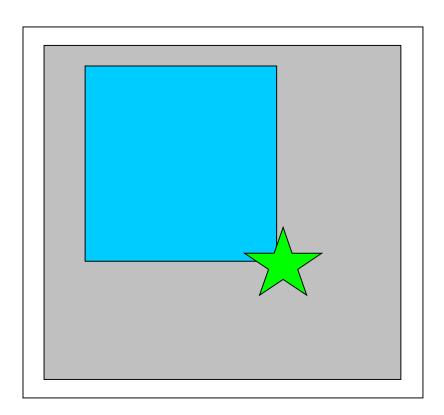

This function gives user a method to implement irregular display window. User can make foreground 0 and foreground 1 to different shape. The color key has two implements mode that called color key and mask color key.

Color Key mode is mean to mask a chosen color and show others.

Mask Color Key mode is mean to only show a chosen color and mask others.

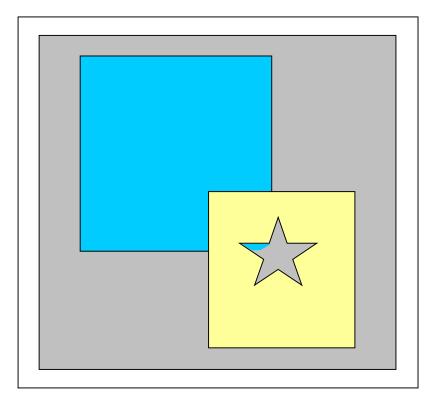

Color key mode

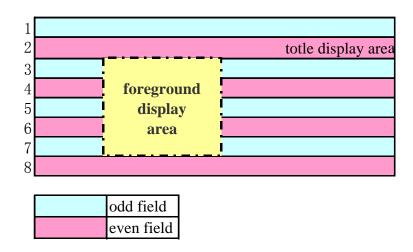

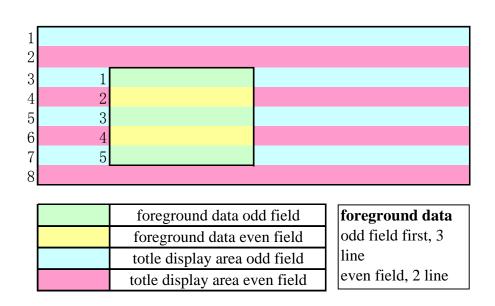

Mask color key mode

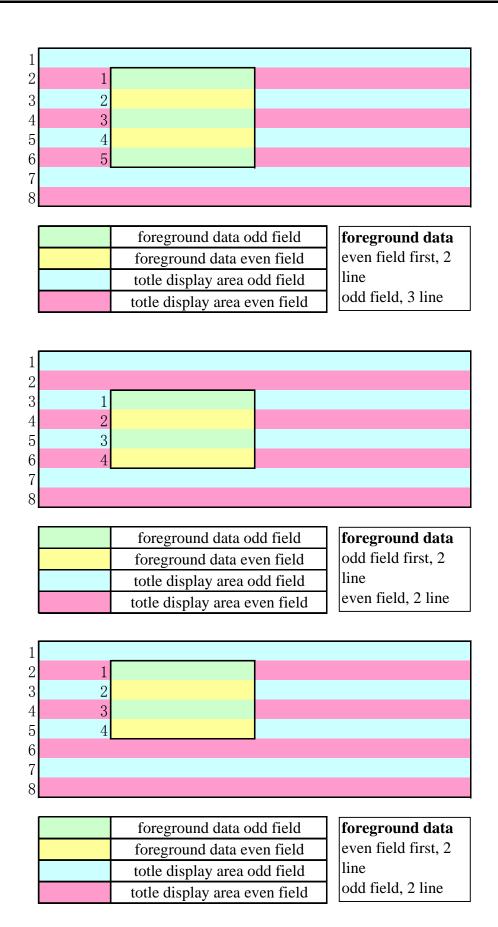

14.7 TV Graphic

Bits	Name	Description	RW
31:28	Reserved	These bits always read 0, and written are ignored.	R
27:16	YPOS	The Y position of top-left part for foreground 0.	RW
15:12	Reserved	These bits always read 0, and written are ignored.	R
11:0	XPOS	The X position of top-left part for foreground 0.	RW

14.8.17 Foreground 1 XY Position Register (LCDXYP1)

Bits	Name	Description	RW
31:28	Reserved	These bits always read 0, and written are ignored.	R
27:16	YPOS	The Y position of top-left part for foreground 1.	RW
15:12	Reserved	These bits always read 0, and written are ignored.	R
11:0	XPOS	The X position of top-left part for foreground 1.	RW

14.8.18 Foreground 0 Size Register (LCDSIZE0)

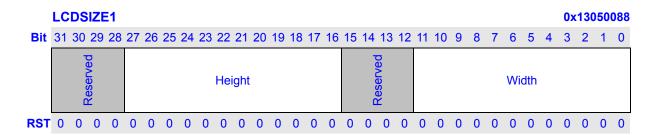

Bits	Name	Description	RW
31:28	Reserved	These bits always read 0, and written are ignored.	R
27:16	Height	The height of foreground 0.	RW
15:12	Reserved	These bits always read 0, and written are ignored.	R
11:0	Width	The width of foreground 0.	RW

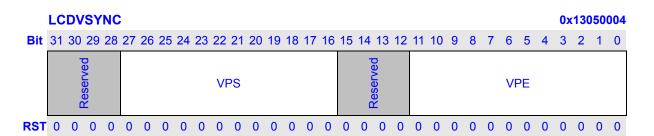

When use TVE interlaced mode, please set the area of F0 and F1 aligned with BST.

14.8.19 Foreground 1 Size Register (LCDSIZE1)

Bits	Name	Description	RW
31:28	Reserved	These bits always read 0, and written are ignored.	R
27:16	Height	The height of foreground 1.	RW
15:12	Reserved	These bits always read 0, and written are ignored.	R
11:0	Width	The width of foreground 1.	RW

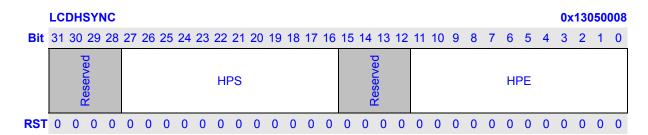

14.8.20 Vertical Synchronize Register (LCDVSYNC)

Bits	Name	Description	RW
31:28	Reserved	These bits always read 0, and written are ignored.	R
27:16	VPS	V-Sync Pulse start position, fixed to 0 (in line clock)	R
15:12	Reserved	These bits always read 0, and written are ignored.	R
11:0	VPE	V-Sync Pulse end position (in line clock)	RW

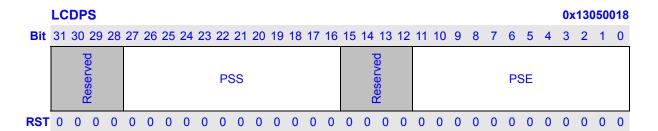

14.8.21 Horizontal Synchronize Register (LCDHSYNC)

Bits	Name	Description	RW
31:28	Reserved	These bits always read 0, and written are ignored.	R
27:16	HPS	H-Sync pulse start position (in dot clock)	RW
15:12	Reserved	These bits always read 0, and written are ignored.	R
11:0	HPE	H-Sync pulse end position (in dot clock)	RW

14.8.22 PS Signal Setting (LCDPS)

Bits	Name	Description	RW
31:28	Reserved	These bits always read 0, and written are ignored.	R
27:16	PSS	PS signal start position (in dot clock).	RW
		In STN mode, PS signal is ignored. But this register is used to define the	
		AC BIAS signal. AC BIAS signal will toggle very N lines per frame. PSS	
		defines the Toggle position.	
15:12	Reserved	These bits always read 0, and written are ignored.	R
11:0	PSE	PS signal end position (in dot clock).	RW
		In STN mode, PSE defines N, which described in PSS.	

14.8.23 CLS Signal Setting (LCDCLS)

	LCDCLS																						0x	130	500)1C

27:16	REVS	REV signal start position (in dot clock)	RW
15:0	Reserved	These bits always read 0, and written are ignored.	R

14.8.26 Interrupt ID Register (LCDIID)

LCDIID is a read-only register that contains a copy of the Frame ID register (LCDFID) from the descriptor currently being processed when a start of frame (SOF) or end of frame (EOF) interrupt is generated. LCDIID is written to only when an unmasked interrupt of the above type is signaled and there are no other unmasked interrupts in the LCD controller pending. As such, the register is considered to be sticky and will be overwritten only when the signaled interrupt is cleared by writing the LCD controller status register. For dual-panel displays, LCDIID is written only when both channels have reached a given state.

LCDIID is written with the last channel to reach that state. (i.e. LCDFID of the last channel to reach SOF would be written in LCDIID if SOF interrupts are enabled). Reserved bits must be written with zeros and reads from them must be ignored.

Bits	Name	Description	RW
31:0	IID	A copy of Frame ID register, which transferred from Descriptor.	RW

14.8.27 Descriptor Address Register0, 1 (LCDDA0, 1)

A frame descriptor is a 4-word block, aligned on 4-word (16-byte) boundary, in external memory:

WORD [0] contains the physical address for next LCDDAx

WORD [1] contains the physical address for LCDSAx

WORD [2] contains the value for LCDFIDx

WORD [3] contains the value for LCDCMDx

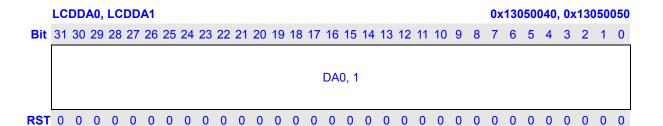

Software must write the physical address of the first descriptor to LCDDAx before enabling the LCD Controller. Once the LCD Controller is enabled, the first descriptor is read, and all 4 registers are written by the DMAC. The next frame descriptor pointed to by LCDDAx is loaded into the registers for the associated DMA channel after all data for the current descriptor has been transferred.

Note: If only one frame buffer is used in external memory, the LCDDAx field (word [0] of the frame descriptor) must point back to itself. That is to say, the value of LCDDAx is the physical address of itself.

Read/write registers LCDDA0 and LCDDA1, corresponding to DMA channels 0 and 1, contain the physical address of the next descriptor in external memory. The DMAC fetches the descriptor at this

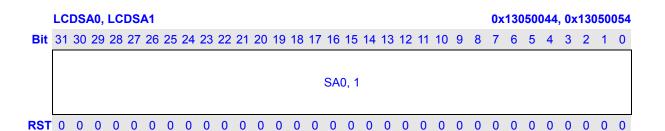

location after finishing the current descriptor. On reset, the bits in this register are zero. The target address must be aligned to 16-byte boundary. Bits [3:0] of the address must be zero.

Bits	Name	Description	RW
31:0	DA0, 1	Next descriptor physical address. And descriptor structure as following:	RW
		WORD [0]: next descriptor physical address.	
		WORD [1]: the buffer physical address.	
		WORD [2]: the buffer ID value. (Only for debug)	
		WORD [3]: the buffer property. The value is same as LCDCMD.	

14.8.28 Source Address Register0, 1 (LCDSA0, 1)

Registers LCDSA0 and LCDSA1, corresponding to DMA channels 0 and 1, contain the physical address of frame buffer or palette buffer in external memory. The address must be aligned on a 4, 8, or 16 word boundary according to register LCDCTRL.BST. If this descriptor is for palette data, LCDSA0 points to the memory location of the palette buffer. If this descriptor is for frame data, LCDSAx points to the memory location of the frame buffer. This address is incremented by hardware as the DMAC fetches data from memory. If desired, the Frame ID Register can be used to hold the initial frame source address.

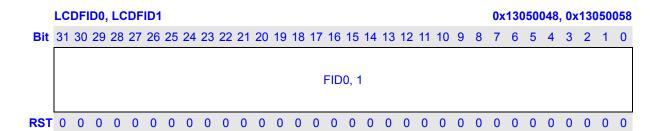

Bits	Name	Description	RW
31:0	SA0, 1	Buffer start address. (Only for driver debug)	R

14.8.29 Frame ID Register0 (LCDFID0, 1)

Registers LCDFID0 and LCDFID1, corresponding to DMA channels 0 and 1, contain an ID field that describes the current frame. The particular use of this field is up to the software. This ID register is copied to the LCD Controller Interrupt ID Register when an interrupt occurs.

Bits	Name	Description	RW
31:0	FID0, 1	Frame ID. (Only for debug)	R

14.8.30 DMA Command Register0, 1 (LCDCMD0, 1)

	LC	DCMD0, LCDCMD1 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 LED THE COMPANY OF THE																				0x1	30	500	4C,	0x	130	500	5C			
Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	SOFINT	EOFINT	CMD	PAL		Recented	ואפספו אפת													LE	ΞN											
RST	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bits	Name	Description	RW
31	SOFINT	Enable start of frame interrupt.	R
		When SOFINT =1, the DMAC sets the start of frame bit	
		(LCDSTATE.SOF) when starting a new frame. The SOF bit is set after a	
		new descriptor is loaded from memory and before the palette/frame data	
		is fetched. In dual-panel mode, LCDSTATE.SOF is set only when both	
		channels reach the start of frame and both frame descriptors have	
		SOFINT set. SOFINT must not be set for palette descriptors in dual-panel	
		mode, since only one channel is ever used to load the palette descriptor.	
30	EOFINT	Enable end of frame interrupt.	R
		When EOFINT =1, the DMAC sets the end of frame bit (LCDSTATE.EOF)	
		after fetching the last word in the frame buffer. In dual-panel mode,	
		LCDSTATE.EOF is set only when both channels reach the end of frame	
		and both frame descriptors have EOFINT set. EOFINT must not be set for	
		palette descriptors in dual-panel mode, since only one channel is ever	
		used to load the palette descriptor.	
29	CMD	It is used to distinguish command and data in lcm mode. And it is only	R
		loaded via DMA channel 0.	
		1: The data is command.	
		0: The data is data.	
28	PAL	The descriptor contains a palette buffer.	R
		PAL indicates that data being fetched will be loaded into the palette RAM.	

		If PAL =1, the palette RAM data is loaded via DMA channel 0 as follows: In bpp1, 2, 4, 8 mode, software must load the palette at least once after	
		enabling the LCD. In bpp16 mode, PAL must be 0.	
27:24	Reserved	These bits always read 0, and written are ignored.	R
23:0	LEN	The buffer length value (in WORD).	R
		The LEN bit field determines the number of bytes of the buffer size	
		pointed by LCDSAx. LEN = 0 is not valid. DMAC fetch data according to	
		LEN. Each time one or more word(s) been fetched, LEN is decreased	
		automatically. Software can read LEN.	

14.8.31 DMA OFFSIZE Register0, 1 (LCDOFFS0, 1)

Bits	Name	Description	RW
23:0	OFFSIZE0, 1	OFFSIZE value for DMA 0,1. Indicate the offset in word.	R
		*please notice that when you need OFFSIZE function, to set this reg	
		to an un-zero value and also need to set LCDPW0, 1 to indicate how	
		much word in one line of this frame.	

14.8.32 DMA Page Width Register0, 1 (LCDPW0, 1)

Bits	Name	Description	RW
23:0	PAGEWIDTH0, 1	Page width for DMA 0,1	R
		* When you set LCDOFFS.OFFSIZE0/1 to 0, you need not care	
		the PAGEWIDTH0/1	

14.8.33 DMA Commend Counter Register0, 1 (LCDCNUM0,1)

LCD mode).

When LCDCMD.CMD = 1, 0x13050068, 0x13050078 is use as LCDCNUM0, 1

LCDCNUM0, LCDCNUM1 0x13050068, 0x13050078 Bit 31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0 **CNUM**

14.10 Display Timing

14.10.1 General 16-bit and 18-bit TFT Timing

This section shows the general 16-bit and 18-bit TFT LCD timing diagram, the polarity of signal "Vsync", "Hsync", and "PCLK" can be programmed correspond to the LCD panel specification.

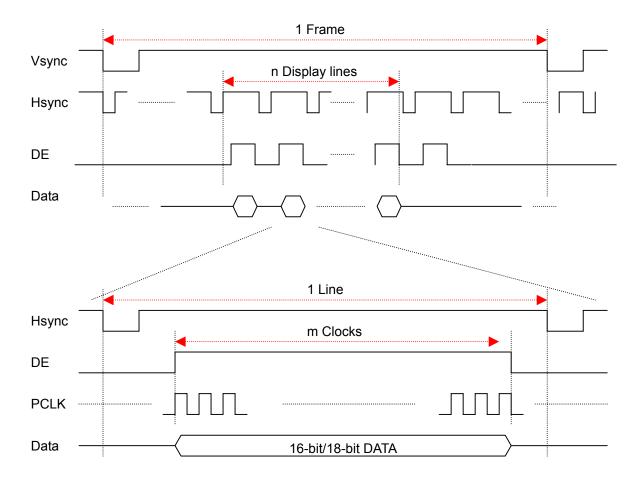

Figure 14-2 General 16-bit and 18-bit TFT LCD Timing

14.10.2 8-bit Serial TFT Timing

This section shows the 8-bit serial TFT LCD timing diagram, the polarity of signal "Vsync", "Hsync", and "PCLK" can be programmed correspond to the LCD panel specification.

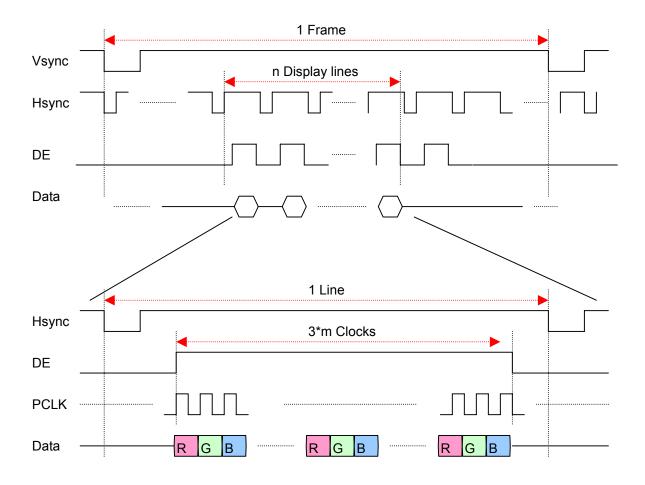

Figure 14-3 8-bit serial TFT LCD Timing (24bpp)

14.10.3 Special TFT Timing

Based on the general TFT LCD support, this controller also provides 4 special signals that can be programmed to general some special timing used for some panel. All 4 signals are worked in two modes: pulse mode and toggle mode. Signal "CLS" is fixed in pulse mode, and "REV" in toggle mode. The work mode of signals "SPL" and "PS" are defined in the special TFT LCD mode 1 to mode 3, either pulse mode or toggle mode. The position and polarity of these 4 signals can be programmed via registers. The Figures show the two modes as follows: (The toggle mode of signal "SPL" is different with the others signal. "SPL" does toggle after display line.)

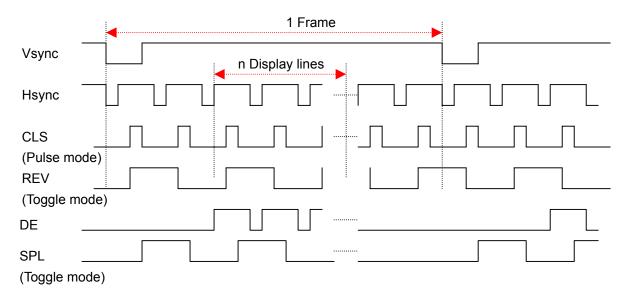

Figure 14-4 Special TFT LCD Timing 1

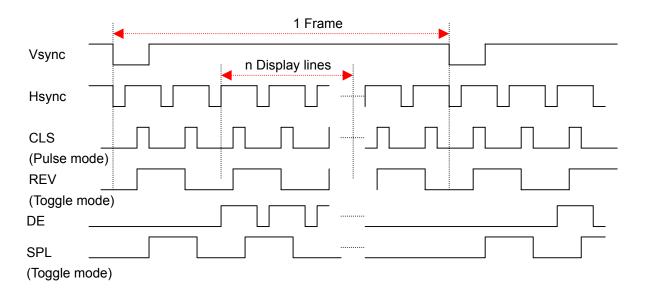

Figure 14-5 Special TFT LCD Timing 2

These two Figures show the timing of pulse mode and toggle mode, the pulse mode timing is same

and the toggle mode timing is different. Timing 1 shows the condition when the total lines in 1 frame is odd (the number of display is even and the number of blank is odd), so the phase of REV inverse at the first line of each frame and the phase of SPL dose not inverse at the first line of each frame. Timing 2 shows the condition when the total lines in 1 frame is even (the number of display is even and the number of blank is even), so the phase of REV and SPL dose not inverse at the first line of each frame.

When LCDC is enabled ,there will be a null line to be add before transferring data to LCD panel. So the toggle mode exept SPL signal of special 3 TFT mode is when reset level is high,the first valid edge will be rising edge. SPL signal of special 3 TFT mode is when reset level is high,the first valid edge will be falling edge.

14.10.4 Delta RGB panel timing

This section shows the Delta RGB timing diagram, the polarity of signal "Vsync", "Hsync", and "PCLK" can be programmed. And the odd/even line RGB order also can be programmed correspond to the LCD panel specification.

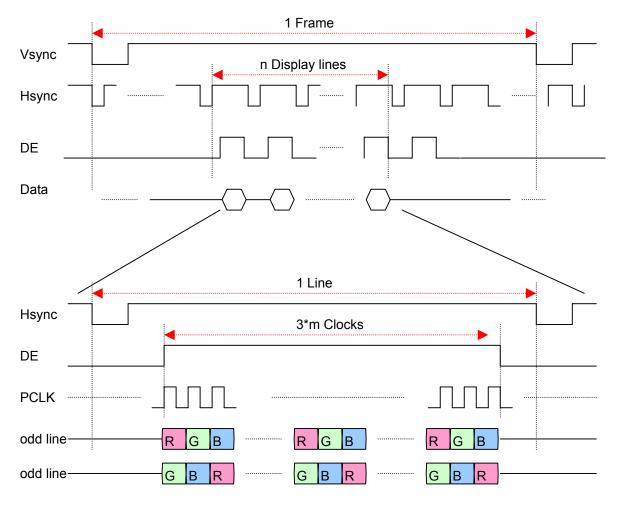

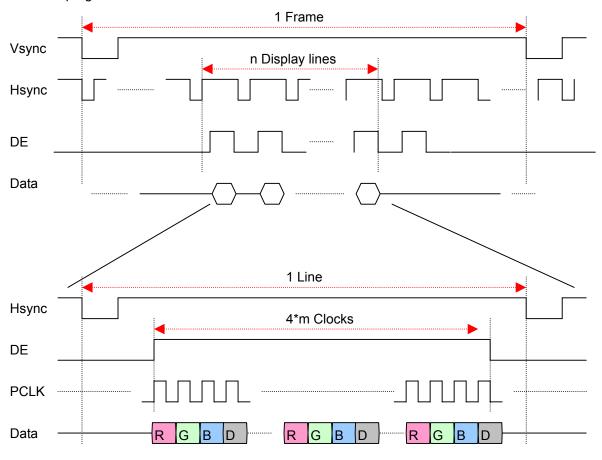

Figure 14-6 Delta RGB timing

14.10.5 RGB Dummy mode timing

This section shows the RGB Dummy diagram, the polarity of signal "Vsync", "Hsync", and "PCLK" can be programmed.

*Dummy = 0

Figure 14-7 RGB Dummy timing

14.11 Format of Palette

This LCD controller contains a palette RAM with 256-entry x 16-bit used only for BPP8, BPP4, BPP2 and BPP1. Palette RAM data is loaded directly from the external memory palette buffer by DMAC channel 0. Each word of palette buffer contains 2 palette entries.

- 1. In 8-bpp modes, palette buffer size is128 words.
- 2. In 4-bpp modes, palette buffer size is 8 words.
- 3. In 2-bpp modes, palette buffer size is 2 words.
- 4. In 1-bpp modes, palette buffer size is 1 word.
- 5. In 16/18/24-bpp modes, has no palette buffer.

Palette buffer base address	Bit: 31 16	Bit: 15 0
Palette entry	Entry-1 bit: 15 0	Entry-0 bit: 15 0
Palette buffer base address + 4	Bit: 31 16	Bit: 15 0
Palette entry	Entry-3 bit: 15 0	Entry-2 bit: 15 0
Palette buffer base address + 8	Bit: 31 16	Bit: 15 0
Palette entry	Entry-5 bit: 15 0	Entry-4 bit: 15 0

14.11.1 STN

For STN Panel, 16-bpp pixel data is encoded with RGB 565 or RGB 555.

Please refer to register LCDCTRL.RGB.

14.14 LCD Controller Operation

14.14.1 Set LCD Controller Device Clock and Pixel Clock

The LCD Controller has 2 clock input: device clock and pixel clock. The both clocks are generated by CPM (Clock and Power Manager). The frequency of the 2 clocks can be set by CPM registers. CPM registers CPCCR.LDIV and CPCCR.PCS set LCD device clock division ratio, and LPCDR set LCD pixel clock division ratio. Please refer to CPM spec for detail.

LCD device clock is the LCD controller's internal clock while LCD pixel clock is output to drive LCD

panel. There have 2 rules for LCD clocks:

- (1) For TFT Panel, the frequency of LCD device clock must be at least 1.5 times of LCD pixel clock.
- (2) For STN Panel, the frequency of LCD device clock must be at least 3 times of LCD pixel clock.

LCD panel determines the frequency of LCD pixel clock.

14.14.2 Enabling the Controller

If the LCD controller is being enabled for the first time after system reset or sleep reset, all of the LCD registers must be programmed as follows:

- (1) Write the frame descriptors and, if needed, the palette descriptor to memory.
- (2) Program the entire LCD configuration registers except the Frame Descriptor Address Registers (LCDDAx) and the LCD Controller enable bit (LCDCTRL.ENA).
- (3) Program LCDDAx with the memory address of the palette/frame descriptor.
- (4) Enable the LCD controller by writing to LCDCTRL.ENA.

If the LCD controller is being re-enabled, there has not been a reset since the last programming; only the registers LCDDAx and LCDCTRL.ENA need to be reprogrammed. The LCD Controller Status Register (LCDSTATE) must also be written to clear any old status flags before re-enabling the LCD controller.

Once the LCD controller has been enabled, do not write new values to LCD registers except LCDCTRL.ENA or DIS or LCDDA0/1 or LCDOSDC.F0/1EN.

14.14.3 Disabling the Controller

The LCD controller can be disabled in two ways: regular and quick.

(1) Regular disabling:

Regular disabling is accomplished by setting the disable bit, LCDCTRL.DIS. The other bits in LCDCTRL must not be changed — read the register, set the DIS bit, and rewrite the register. This method causes the LCD controller to stop cleanly at the end of a frame. The LCD Disable Done bit, LCDSTATE.LDD, is set when the LCD controller finishes displaying the last frame, and the enable bit, LCDCTRL.ENA, is cleared automatically by hardware.

LCDCTRL.DIS must be set zero when enabling the controller.

(2) Quick disabling:

Quick disabling is accomplished by clearing the enable bit, LCDCTRL.ENA. The LCD controller will finish any current DMA transfer, stop driving the panel, setting the LCD Quick Disable bit (LCDSTATE.QD) and shut down immediately. This method is intended for situations such as a battery fault, where system bus traffic has to be minimized immediately so the processor can have enough time to store critical data to memory before the loss of power. The LCD controller must not be re-enabled until the QD bit is set, indicating that the quick shutdown is complete. Do not set the DIS bit when a quick disabling command has been issued.

Note: It is strongly recommended that software set the "LCD Module Stop Bit" in PMC to shut down LCDC clock supply to save power consumption after disable LCDC. Please refer to PMC for detailed information.

14.14.4 Resetting the Controller

At reset, the LCD Controller is disabled. All LCD Controller Registers are reset to the conditions shown in the register descriptions.

14.14.5 Frame Buffer & Palette Buffer

The starting address of frame buffer stored in external memory must be aligned to 4, 8 or 16 words boundary according to register LCDCTRL.BST. The length of buffer must be multiple of word (32-bit).

If LCDCTRL .BST = 0, align frame and palette buffer to 16 word boundary

If LCDCTRL .BST = 1, align frame and palette buffer to 8 word boundary

If LCDCTRL .BST = 2, align frame and palette buffer to 4 word boundary

One frame buffer contains encoded pixel data of multiple of screen lines; each line of encoded pixel data must be aligned to word boundary. If the length of a line is not the multiple of word, extra bits must be applied to reach a word boundary. It is suggested that the extra bits to be set zero.

14.14.6 CCIR601/CCIR656

CCIR601: just as 16bit-parallel output.

CCIR656: need external encoder, or software designer need give digital blanking data and timing reference signal in data buffer.

14.14.7 OSD Operation

1.Normal process:

- a. Configuration
 - * LCDCFG and LCDCTRL

- * LCDOSDC and LCDOSDCTRL
- * LCDRGBC and LCDIPUR
- b. Set Color
 - * LCDBGC, LCDKEY0, LCDKEY1, LCDALHPA
- c. Set Display
 - * LCDVAT, LCDDAH, LCDDAV
 - * LCDXYP0, LCDXYP1, LCDSIZE0, LCDSIZE1
 - * LCDVSYNC, LCDHSYNC
- d. Set DMAC
 - * LCDIID
 - * LCDDA0, LCDSA0, LCDFID0, LCDCMD0, LCDOFFS0, LCDPW0, LCDCNUM0, LCDDESSIZE0
 - * LCDDA1, LCDSA1, LCDFID1, LCDCMD1, LCDOFFS1, LCDPW1, LCDCNUM1, LCDDESSIZE1
- e. Enable LCDC
- f. Check the state from register LCDSTATE and LCDOSDS
 - · Reconfigure OSD

If foreground0 and foreground1 (enable, position, size)need to reconfigure during display process, there has two methods.

Method1:(recommend in TFT and SLCD):

Reconfigure the relate Register after disable LCDC.

In TFT mode, use normal disable to avoid lcd panel flicker.

In SLCD mode, use quick disable (smart LCD could keep the frame by its inner buffer).

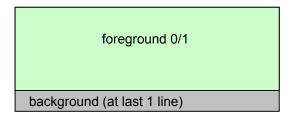

After disable LCDC, you can reconfigure any register/descriptor, but please make sure this process is quick enough in TFT mode (less than the interval between two frame).

Method2:

Dynamic reconfigure the register:

You can reconfigure some register(LCDOSDC.F0/1EN) during display process but there some rule you must follow:

1) Foreground 0/1 are at last 1 line less than background

2) Foreground 0 and foreground 1's data can not less than 33 words (except 0 word).

Or you only can change those register after disable LCDC.

1.When use TFT panel. During the display process, you can re-configure the LCDOSDC.F0EN, LCDCOSDC.F1EN; (You can not change them when use SLCD or TVE) but the new configuration will recognized by LCDC module after finished a complete frame. If you need to re-configure LCDOSDCTRL.IPU to select IPU or DMA channel 1, you need to follow the process below:

- Quick or Normal disable LCDC(SLCD only can use Quick disable)
- o Configure the LCDOSDCTRL to set IPUEN, and then enable LCD.

To change IPU to DMA1 you can:

- Quick or Normal disable LCDC(SLCD only can use Quick disable)
- Configure the LCDOSDCTRL to set IPUEN = 0, and then enable LCD.

2.During the display process, while foreground 1 use IPU, to change size of foreground 1 you need follow the step shown bellow.

- a. Quick or Normal disable LCDC (SLCD only can use Quick disable).
- b. Configure the IPU, and LCDSIZE1.
 - Run IPU and enable LCDC.

3. You **CAN NOT** change BPP or OSDBPP during the display process. if you want to change them first you should disable LCDC, change the BPP or OSDBPP and then enable LCDC.

If you need not use Foreground0 during the whole display process. set BPP to 5.

4. You can change LCDSIZE0/1 during display process without disable LCD controller.

method 1:

- a. Set LCDCOSDC.F0/1EN = 0 (follow the rule above)
- b. Re-configure LCDSIZE0/1 (and the relate DMA0/1 descriptor)then set LCDOSDCTRL.CHANGE = 1
- c. Wait until CHANGE = 0 and then set LCDOSDC.F0/1EN = 1 method 2:
- 1. Set LCDOSDCTRL.CHANGE = 1
- 2. Wait until LCDOSDS. READY = 1
- 3. Change relate DMA0/1 channel descriptor
- 4. Wait until LCDOSDCTRL.CHANGE = 0

*Please notice that in TVE (not include VGA)and SLCD only use method 2

5. You can change LCDXY0/1 during display process without disable LCD controller

Method 1:

- a) Set LCDOSDC.F0/1EN = 0 (follow the rule above)
- b) Change LCDXYPOS0/1 and then set LCDOSDCTRL.CHANGE = 1
- c) Wait until LCDOSDCTRL.CHANGE = 0

Method 2:

Change LCDXYPOS0/1

- Set LCDOSDCTRL.CHANGE = 1
- Wait until LCDOSDCTRL.CHANGE = 0

*Please notice that in TVE (not include VGA) and SLCD only use method 2

*Please notice that if you do not change foreground 0/1's size and position, keep LCDOSDCTRL.CHANGE = 0. And you can only change one of them in one time.

6. How to "close/open" foreground 0 and foreground 1?

Method 1:

Direct change LCDOSDC.F0/1EN, but you must follow the rule above.

Method 2:

Change foreground0/1 size to 0 Without change LCDOSDC.F0/1EN

Method 3: (recommend)

Normal disable LCDC, and change LCDOSDC.F0/1EN. Use normal disable need to wait LCDSTATE.LDD, and set relate register soon, to make sure the LCD panel are not flicker.

*Please notice that in TVE (not include VGA) and SLCD only use method 2,3. And strongly suggest that DO NOT close both foreground0 and 1 or set both foreground0 and 1 's size to 0.

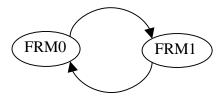

14.14.8 Descriptor Operation

1. TFT panel

Not use palette: you can use only one descriptor or several connected descriptor. As which shown below.

Use palette: add one PAL descriptor at the beginning of descriptor chain.

When you need to change palette during the display you need follow the steps shown below.

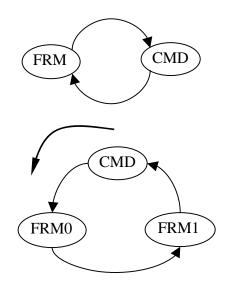

*Please notice that you **cannot** disable foreground 0 during the whole process. and also You can not change PAL when Foreground 0's area == 0 or not enable LCDOSDC.F0EN

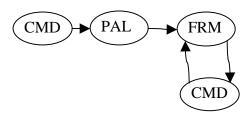

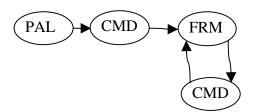

2. SLCD

Not use palette.

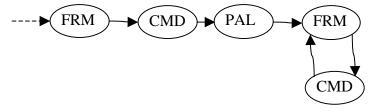

Use palette.

Change palette.

You can not change PAL when Foreground 0's area == 0. Or not enable LCDOSDC.F0EN and during you change PAL, you can not change F0 or F1's size

14.14.9 IPU direct connect mode

When you use IPU direct connect mode, you need to:

- 1. Open IPU early than LCDC
- 2. Use normal disable in TFT mode, and use quick disable in SLCD/TVE mode
- 3. When you use normal disable you need to wait IPU frame end flag.
- 4. When you use quick disable you must not wait IPU frame end flag, and must

reset IPU before restart LCDC and IPU.

5. In SLCD mode, you can first wait IPU frame end flag, then quick stop LCDC.

Then you need not

reset IPU before restart LCDC and IPU.

* "IPU frame end flag" please refer to IPU spec.

14.14.10 VGA output

When you use VGA output you need:

- 1) Open all channel of DAC (refer to TVEDAC spec)
- 2) Set TVEN to 0
- 3) Disable LCD panel pins (except HSYNC/VSYNC) for save power (refer to GPIO spec)

15 Smart LCD Controller

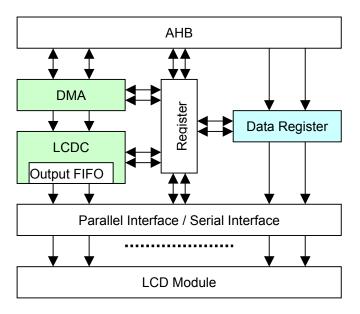

15.1 Overview

The Smart LCD Controller affords an interface to transfer data from the LCD controller to the LCD Module. It supports DMA operation and register operation.

Features:

- Supports a large variety of LCD Module from different vendors.
- Supports parallel and serial interfaces.
- Supports different size of display panel.
- Supports different width of pixel data.
- Supports internal DMA operation and register operation.
- Supports Write Operation. Read Operation is not supported.

15.2 Structure

*Please notice that the command only can transfer by DMA channel 0. No matter the DMA channel 1 or IPU are use or not.

15.3 Pin Description

Table 15-1 SLCD Pins Description

Name	I/O	Description	Interface
SLCD_RS	0	Command/Data Select Signal. The	Serial: RS
		polarity of the signal can be	Parallel: RS
		programmable.	
SLCD_CS	0	Data Sample Signal. The polarity of	Serial: CS
		the signal can be programmable.	Parallel: Sample Data
			with the edge of CS
SLCD_CLK	0	The clock of SLCD. The polarity of the	Serial or not used
		clock can be programmable.	
SLCD_DAT*1 [17:0]	0	The data of SLCD.	Serial:
			SLCD_DAT [15]
			Parallel:
			SLCD_DAT [17:0]
			SLCD_DAT [15:0]
			SLCD_DAT [7:0]
LCD_LO6_O	0	24 bit parallel SLCD RGB (or 24 bit	detail in GPIO spec
		command) low bit	
		([17:16],[9:8],[1:0]) output	

Note*¹: SLCD_DAT [15] is also use as data pin for serial. The SLCD pins are shared with LCDC. You can see the set of register LCDCFG.LCDPIN in LCDC spec.

15.4 Register Description

In this section, we will describe the registers in Smart LCD controller. Following table lists all the registers definition. All register's 32bit address is physical address. And detailed function of each register will be described below.

Name	Description	RW	Reset Value	Address	Access
					Size
MCFG	SLCD Configure Register	RW	0x0000	0x130500A0	32
MCTRL	SLCD Control Register	RW	0x00	0x130500A4	8
MSTATE	SLCD Status Register	RW	0x00	0x130500A8	8
MDATA	SLCD Data Register	RW	0x00000000	0x130500AC	32

.

15.4.1 SLCD Configure Register (MCFG)

The register MCFG is used to configure SLCD.

MCFG													0x1	305	00/	40
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
		Reserved			DWIDTH		CWIDTH			Reserved		CSPLY	RSPLY	Reserved	CLKPLY	TYPE
RST	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bits	Name		Description	RW
15:13	Reserved	These bits alv	ways read 0, and written are ignored.	R
12:10	DWIDTH*1	Data Width.		RW
		DWIDTH	Data Width	
		000	18-bit once Parallel/Serial	
		001	16-bit once Parallel/Serial	
		010	8-bit third time Parallel	
		011	8-bit twice Parallel	
		100	8-bit once Parallel/Serial	
		101	24-bit once Parallel	
		111	9-bit twice Parallel	
		110	Reserved	
		*Please notic	e that you can only use 24-bit parallel command when	
		use 24-bit par	rallel data. (The command may not 24-bit but need put	
		them as 24-b	it in memory(one command use one word))	

9:8	CWIDTH*1	Command Wi	dth.	RW
		CWIDTH	Command Width	
		00	16-bit once / 9bit once	
		01	8-bit once	
		10	18-bit once	
		11	24-bit once	
		*Please notice	e that you can only use 24-bit parallel command when	
		use 24-bit par	allel data. (The command may not 24-bit but need put	
		them as 24-bi	t in memory (one command use one word))	
7:5	Reserved	These bits alw	vays read 0, and written are ignored.	R
4	CSPLY	CS Polarity. (0	CS initial level will be different from CS Polarity)	RW
		0: Active Leve	el is Low	
		1: Active Leve	el is High	
3	RSPLY	RS Polarity.		RW
		0: Command	RS = 0, Data RS = 1	
		1: Command	RS = 1, Data RS = 0	
2	Reserved	These bits alw	vays read 0, and written are ignored.	R
1	CLKPLY	LCD_CLK Pol	arity.	RW
		0: Active edge	e is Falling	
		1: Active edge	e is Rising	
0	TTYPE	Transfer Type	:	RW
		0: Parallel		
		1: Serial		

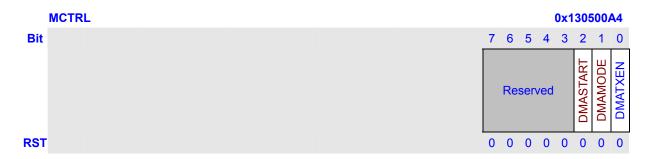

Note*1: The set of DWIDTH and CWIDTH should keep to the rules as follows:

Interface Mode	Command Width	Data Width	Color
Parallel	18-bit	18-bit once	R6G6B6
	16-bit	16-bit once	R5G6B5
		9-bit twice	
	9-bit	9-bit twice	
	8-bit	8-bit once	
		8-bit twice	
		8-bit third times	
Serial	18-bit	18-bit once	
	16-bit	16-bit once	
	9-bit	9bit twice	
	8-bit	8-bit once	
		8-bit twice	
		8-bit third times	

15.4.2 SLCD Control Register (MCTRL)

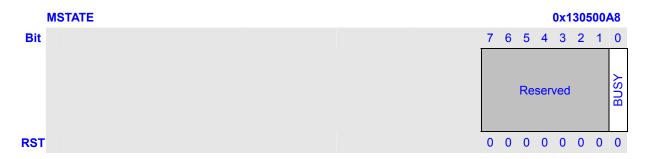

MCTRL is SLCD Control Register.

Bits	Name	Description	RW
7:3	Reserved	These bits always read 0, and written are ignored.	R
2	DMAMODE	SLCD descriptor DMA mode select:	
		0: DMA will continually transfer data follow descriptor chain.	
		1: DMA will stop when one descriptor finished.	
1	DMASTART	Only use when DMAMODE = 1, set 1 to restart DMA transfer.	
0	DMATXEN	SLCD DMA Transfer Enable.	RW
		This bit is only used for DMA automatic transfer.	
		(1) This bit starts the automatic transfer of image data from system	
		memory to LCDM.	
		(2) When DMAC finishes transferring the data, and the	
		MSTATE.BUSY bit is 0, you can clear DMATXEN bit to stop DMA	
		mode.	

15.4.3 SLCD Status Register (MSTATE)

The register of MSTATE is SLCD status register.

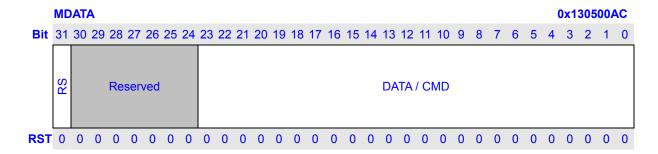

Bits	Name	Description	RW
7:1	Reserved	These bits always read 0, and written are ignored.	R
0	BUSY	Transfer is working or not.	RW
		This bit will be set to 1 when transfer is working. It will be cleared by	
		hardware when transfer is finished.	

	0: not busy	
	1: busy	

15.4.4 SLCD Data Register (MDATA)

The register MDATA is used to send command or data to LCM. When RS=0, the low 24-bit is used as command. When RS=1, the low 24-bit is used as data.

Bits	Name	Description	RW
31	RS	The RS bit of data register is used to decide the meanings of the low	RW
		24-bit.	
		0: data	
		1: command	
30:24	Reserved	These bits always read 0, and written are ignored.	R
23:0	DATA/CMD	Data or Command Register.	RW

15.5 System Memory Format

15.5.1 Data format

you can configure these registers according to LCDC module.

15.5.2 Command Format

(1) 18-bit command

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Х	Χ	Χ	Χ	Х	Χ	Χ	Χ	Χ	Χ	Χ	Χ	Χ	Χ	C17	C16
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
C15	C14	C13	C12	C11	C10	C9	C8	C7	C6	C5	C4	C3	C2	C1	C0

(2) 16-bit command

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
C15	C14	C13	C12	C11	C10	C9	C8	C7	C6	C5	C4	C3	C2	C1	CO
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
C15	C14	C13	C12	C11	C10	C9	C8	C7	C6	C5	C4	C3	C2	C1	C0

(3) 9-bit command once

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Х	Х	Х	Х	Х	Х	C9	C8	C7	C6	C5	C4	C3	C2	C1	C0
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Х	Х	Х	Χ	Х	Χ	C9	C8	C7	C6	C5	C4	C3	C2	C1	C0

(4) 8-bit command once

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
C7	C6	C5	C4	C3	C2	C1	C0	C7	C6	C5	C4	C3	C2	C1	C0
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
C7	C6	C5	C4	C3	C2	C1	C0	C7	C6	C5	C4	C3	C2	C1	C0

(5) 8-bit command twice (Command = command part + data part)

*Please notice that when you use this kind command, set CWIDTH as 8bit once and set the LCDCNUM.CNUM as doubled the real command number.

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
D7	D6	D5	D4	D3	D2	D1	D0	C7	C6	C5	C4	C3	C2	C1	CO
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
D7	D6	D5	D4	D3	D2	D1	D0	C7	C6	C5	C4	C3	C2	C1	C0

15.6 Transfer Mode

Two transfer modes can be used: DMA/IPU Transfer Mode and Data Register Transfer Mode. In DMA/IPU mode, always transfer commands by DMA 0

15.6.1 DMA Transfer Mode

Command and data can be recognized by RS bit coming from memory. The format of DMA transfer can be as follows:

(1) Command and Data

*Please notice that the command only can insert between two complete frame and the number of command is 0~255.

(2) Only Data

*You can also not use command but you still need to use a command descriptor and set the CNUM = 0

Because DMA transfer mode only can work in OSD mode, you need to configure the panel according OSD mode:

- 1.Configuration
 - * LCDCFG and LCDCTRL
 - * LCDOSDC and LCDOSDCTRL
 - * LCDRGBC and LCDIPUR

2.Set Color

* LCDBGC, LCDKEY0, LCDKEY1, LCDALHPA

3.Set Display

- * LCDVAT, LCDDAH, LCDDAV
- * LCDXYP0, LCDXYP1, LCDSIZE0, LCDSIZE1
- * LCDVSYNC, LCDHSYNC

4.Set DMAC

- * LCDIID
- * LCDDA0, LCDSA0, LCDFID0, LCDCMD0, LCDOFFS0, LCDPW0, LCDCNUM0, LCDDESSIZE0
- * LCDDA1, LCDSA1, LCDFID1, LCDCMD1, LCDOFFS1, LCDPW1, LCDCNUM1, LCDDESSIZE1
- 5 Enable slcd DMA
- 6.Enable LCDC

15.6.2 Register Transfer Mode

Each time you can write a command or a data to the register, then it will transfer the RS signal and data or command to LCM. Command and data can be recognized by RS bit coming from data register. The format of data register transfer can be as follows:

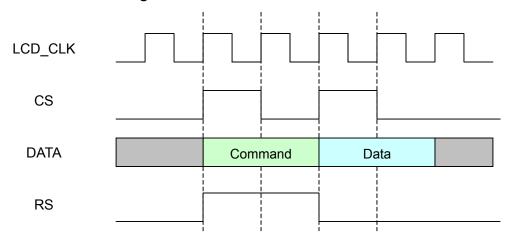

RS Data Or Command

Command	RS [31] = 1	XXX [30:n-	+1]	Commai	nd [n:0]		
	RS [31] = 0	XXX [30:24]		Data [23:0]		
Data	RS [31] = 0	XXX [30:16]	Da	ata [15:0]		
	RS [31] = 0		XXX [30:9]		Data [8:0]		
	RS [31] = 0		XXX [30:8]]	Data [7:0]		

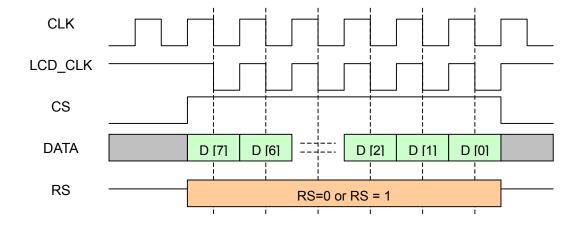

15.7 Timing

15.7.1 Parallel Timing

15.7.2 Serial Timing

15.8 Operation Guide

15.8.1 DMA Operation

1 Start DMA transfer

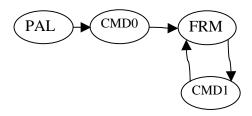

- 1. Set LCDCFG.MODE to 1101 to choose LCM.
- 2. Set LCDCTRL.BST to choose burst length for transferring.
- Set register LCDIID0, LCDDA0, LCDSA0, LCDFID0, LCDCMD0, LCDOFFS0, LCDPW0, LCDCNUM0, LCDDESSIZE0 to initial internal DMA.
- 4. Also set register LCDIID1, LCDDA1, LCDSA1, LCDFID1, LCDCMD1, LCDOFFS1, LCDPW1, LCDCNUM1, LCDDESSIZE1 when use DMA channel 1 in OSD mode
- 5. Set MCFG to configure SLCDC.

- 6. Before starting DMA, Wait for MSTATE.BUSY == 0.
- Set MCTRL.DMATXEN to 1 to prepare DMA transfer.
 Note that if you don't want to stop DMA transfer, you need not to check MSTATE.BUSY.
- 8. Set LCDCCTRL.ENA to 1 to start LCDC internal DMA.
- The LCDC internal DMA will transfer data to SLCDC, and SLCDC transfer data to LCM.
 Repeat this step till you want to close the SLCDC to transfer data to LCM Panel.

*please notice that use and only use DMA0 to transfer command no matter use DMA0 to transfer frame data or not.

One recommend descriptor chain (CMD0 with CNUM>0 and CMD1 with CNUM=0):

2 Stop DMA transfer

- Set LCDCCTRL.ENA to 0 to stop LCDC internal DMA at once.
- Wait till MSTATE.BUSY is set to 0 by hardware.
 MSTATE.BUSY == 1: there is data in the FIFO waited for transferring to LCM.
 MSTATE.BUSY == 0: all data in the FIFO have finished transferring to LCM.
- Set MCTRL.DMATXEN to 0 to stop DMA transfer.

3 Restart DMA transfer

When MCTRL.DMATXEN is set to 0, and then you want to restart DMA transfer at once, you should ensure that MCTRL.DMATXEN must keep 0 at least three cycles of PIXCLK.

15.8.2 Register Operation

- (1) Set MCFG to configure SLCD.
- (2) Wait for MSTATE.BUSY == 0.
- (3) Set MDATA register.
- (4) Wait for MSTATE.BUSY == 0.
- (5) Set MDATA register.
- (6) Wait for MSTATE.BUSY == 0.
- (7)

16 TV Encoder

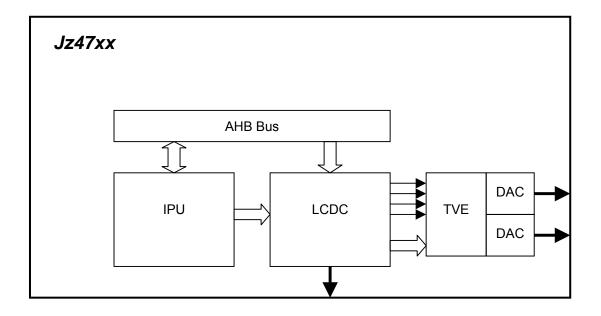

16.1 Overview

The TV Encoder enables the data for LCD panel showing in TV screen.

Features:

- CVBS and S-video output
- PAL and NTSC supported

16.2 Structure

16.3 Pin Description

Table 16-1 TVE Pins Description

Name	I/O	Description	Interface
YCMP	AO	CVBS or Luma of S-Video analog output	
С	AO	Chroma of S-Video analog output	

16.4 Register Description

TVE memory mapped registers are put together with LCD controller, occupied address area of $^{\circ}$ H13050140 $^{\circ}$ $^{\circ}$ H130501FF. Following table lists all the registers definition. All register's 32bit address is physical address. And detailed function of each register will be described below.

Name	Description	RW	Reset Value	Address	Size
TVECR	TV Encoder Control register	RW	0x01040301	0x13050140	32
FRCFG	Frame configure register	RW	0x00170271	0x13050144	32

Bits	Name	Description										
31:29	Reserved	These bits always read 0, and written are ignored.										
28	Reserved	These bits always	ays read 0, and written are ignored.	R								
27:26	Reserved	These bits always	ays read 0, and written are ignored.	R	1							
25	YUV	set this bit to 1	et this bit to 1 to enable yuv output									
24	ECVBS	Enable CVBS ((Composite Video Baseband Signal) output. Thi	is bit is R\	W							
		used to choose	e the TVE output signal format between CVBS a	and								
		S-Video										
		ECVBS	Description									
		1	TVE outputs CVBS format signal to TV									
		0	TVE outputs S-Video format signal to TV									
23	DAPD3	DAC 3 power of	down. When it is 1, power down DAC 3, the Cr	of R\	W							
		components vi	deo, or the BLUE of VGA									
22	DAPD2	DAC 2 power of	down. When it is 1, power down DAC 2, the chro	oma of R\	W							
		S-Video, or the	S-Video, or the Cb of components video, or the GREEN of VGA									
21	DAPD1	DAC 1 power down. When it is 1, power down DAC 1, the CVBS, or the										
		luma of S-Vide	luma of S-Video, the Y of components video, or the RED of VGA									
20	DAPD	DAC power do	wn. When it is 0, power down all DACs	R\	W							
19	Reserved	These bits always	ays read 0, and written are ignored.	R								
18:16	YCDLY	(internal used o	only)	R\	W							
15:14	CGAIN	Chrominance r	modulated signal gain factor setting when it is a	dded to R\	W							
		luminance sign	al in composite output format.									
		CGAIN	Description									
		00	1									
		01	1/4									
		10	1/2									
		11	3/4									
13:12	CBW	Bandwidth sett	ing for chrominance filter.	R\	W							
		CBW	Description									
		00	Narrow band									
		01 Wide band										

		10	Extra wide band								
		11	Ultra wide band								
11:10	Reserved	These bits alw	ways read 0, and written are ignored.	R							
9	SYNCT	Choose the se	equence of field synchronizing pulses duration.	RW							
		SYNCT	Description								
		0	The duration of sequence of field								
			synchronizing pulses is 3 H, where H is a line								
			period. Set SYNCT to this for NTSC TV set								
		1	The duration of sequence of field								
			synchronizing pulses is 2.5 H. Set SYNCT to								
			this for PAL TV set								
8	PAL	Set this to 1 fo	or PAL TV set, 0 for NTSC TV set	RW							
7	FINV	When this bit	is 1, invert top and bottom fields	RW							
6	ZBLACK	Black of lumin	Black of luminance (Y) input is 0. Set this bit to 1 if the input video								
		luminance dat	ta for black is 0. Set this bit to 0 if the input video								
		luminance dat	ta for black is 16. When this bit is 0, the Y input d	lata will							
		be clamped to	0 ≥ 16.								
5	CR1ST	This bit descri	bed the Cb and Cr data order in input video.	RW							
		ECVBS	Description								
		0	Cb comes before Cr, which is ITU656								
			standard								
		1	Cr comes before Cb								
4	CLBAR	Color bar mod	de. In this mode, a color bar picture is output to T	V RW							
		CLBAR	Description								
		0	Output input video to TV								
		1	Output color bar to TV								
3	Reserved	These bits alw	ways read 0, and written are ignored.	R							
2	Reserved	These bits alw	vays read 0, and written are ignored.								
	Reserved Reserved		vays read 0, and written are ignored. vays read 0, and written are ignored.	R							

16.4.2 Frame configure register (FRCFG)

This register is used to configure line in a frame.

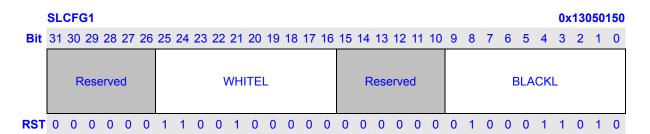

Bits	Name	Description	RW
31:24	Reserved	These bits always read 0, and written are ignored.	R
23:16	L1ST	This field defines the first active video line of a field. The reset value	RW
		is 23 in decimal. The frame active video line number is (NLINE – 1 –	
		2 * L1ST). The top and bottom field line number is a half of the frame	
		line number.	
15:10	Reserved	These bits always read 0, and written are ignored.	R
9:0	NLINE	This field defines number of lines per-frame. The reset value is 625 in	RW
		decimal.	

16.4.3 Signal level configure register 1, 2 and 3 (SLCFG1, SLCFG2, SLCFG3)

These registers are used to configure the TV signal level in difference phases.

Bits	Name Description									
31:26	Reserved	These bits always read 0, and written are ignored.	R							
25:16	WHITEL	Signal level for white color. The reset value is 800 in decimal	RW							
15:10	Reserved	These bits always read 0, and written are ignored.	R							
9:0	BLACKL	Signal level for black color. The reset value is 282 in decimal	RW							

SLCFG2

Bit 31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0

Bits	Name	Description	RW
31:26	Reserved	These bits always read 0, and written are ignored.	R
25:16	VBLANKL	Signal level in vertical blank period. The reset value is 296 in decimal	RW
15:10	Reserved	These bits always read 0, and written are ignored.	R
9:0	BLANKL	Signal level in other blank period. The reset value is 240 in decimal	RW

Bits	Name	Description	RW
31:8	Reserved	These bits always read 0, and written are ignored.	R
7:0	SYNCL	Signal level in sync period. The reset value is 72 in decimal	RW

16.4.4 Line timing configure register 1 and 2 (LTCFG1, LTCFG2)

These registers are used to configure timing period in a line.

Bits	Name	Description	RW
31:21	Reserved	These bits always read 0, and written are ignored.	R
20:16	FRONTP	Front porch width, 16 cycles of 13.5MHz for 525 line system and 20	RW
		cycles for 625 line	
15	Reserved	These bits always read 0, and written are ignored.	R
14:8	HSYNCW	HSYNC width in cycles of 13.5MHz. The reset value is 63 in decimal.	RW
7	Reserved	These bits always read 0, and written are ignored.	R
6:0	BACKP	Back porch width in cycles of 13.5MHz. The reset value is 78 in	RW
		decimal.

		changing to the incoming Cb data.	
7:0	CRGAIN	Cr gain. The reset value is 137 in decimal. CRGAIN=128 means no	RW
		changing to the incoming Cr data.	

16.5 Switch between LCD panel and TV set

LCD panel → TV set switch

- Step 1. Configure TVE (CVBS/S-Video, N/P, and etc), enable DAC
- Step 2. Disable LCDC. If data is from IPU, stop IPU. Then LCD panel is turned off
- Step 3. Configure LCDC for output via TVE
- Step 4. Configure TVE and LCDC pixel clock and enable TVE clock (CPM).
- Step 5. If data is from IPU, start IPU. Then start LCDC.
- Step 6. Enable TVE (TVECR.SWRST=0). Then data stream from LCDC is output to TV set via TVE

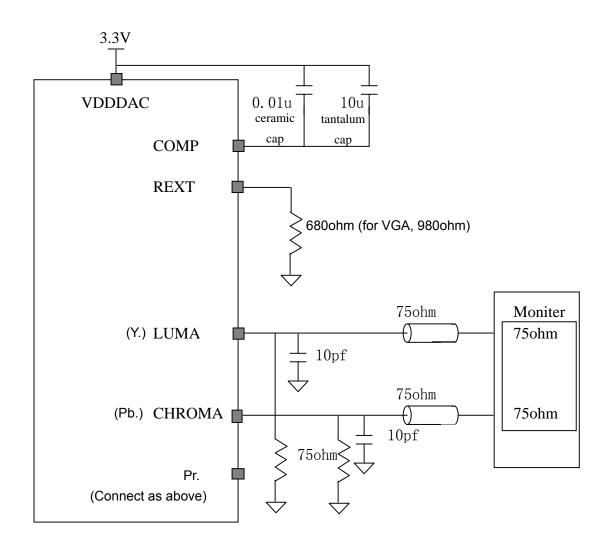

TV set → LCD panel switch

- Step 1. Disable TVE (TVECR.SWRST=1). Then no signal is output to TV set
- Step 2. Disable TVE clock (CPM), and disable DAC.
- Step 3. Disable LCDC. If data is from IPU, stop IPU
- Step 4. Configure LCDC pixel clock. Configure LCDC for output to LCD panel
- Step 5. If data is from IPU, start IPU. Start LCDC. Then LCD panel is work

16.6 DAC

16.6.1 DAC Connection

16.6.2 DAC DC Character

VDDDAC =3.3V;DVDD=1.8V; RL=37.5ohm, CL=10Pf; Temp = 25° C

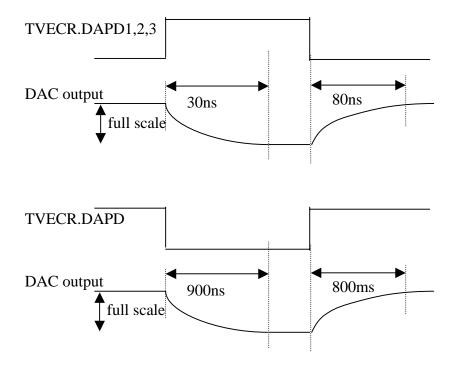

Parameter	Symbol	Min	Type	Max	Unit
Operating voltage range	VDDDAC	3.0	3. 3	3.6	V
Max output voltage	DVDD		1.278		V
DAC resolution			10		bits
Integral non-linearity error	INL		±1LSB	±1.5LSB	LSB
Differential non-linearity er	DNL		±0.5LSB	±1LSB	LSB

16.6.3 DAC Power Down Setup Time

As the output current's max value per channel is 34.1mA, keep the DAC power down when you not use TV encoder.

The relate parameter is measured when VDDDAC = 3.3V and the temperature is 100 $\,^{\circ}\mathrm{C}$

17 AC97/I2S Controller

17.1 Overview

This chapter describes the AIC (AC'97 and I²S Controller) included in this processor.

The AIC supports the Audio Codec '97 Component Specification 2.3 for AC-link format and I2S or IIS (for inter-IC sound), a protocol defined by Philips Semiconductor. Both normal I2S and the MSB-justified I2S formats are supported by AIC.

AIC consists of buffers, status registers, control registers, serializers, and counters for transferring digitized audio between the processor's system memory and an internal I2S CODEC, an external AC97 or I2S CODEC. AIC can record digitized audio by storing the samples in system memory. For playback of digitized audio or production of synthesized audio, the AIC retrieves digitized audio samples from system memory and sends them to a CODEC through the serial connection with AC-link or I2S formats. The internal or external digital-to-analog converter in the CODEC then converts the audio samples into an analog audio waveform. The audio sample data can be stored to and retrieved from system memory either by the DMA controller or by programmed I/O.

The AC-link is a synchronous, fixed-rate serial bus interface for transferring CODEC register control and status information in addition to digital audio. Where both normal I2S and MSB-justified-I2S work with a variety of clock rates, which can be obtained either by dividing the PLL clock by two programmable dividers or from an external clock source.

For I2S systems that support the L3 control bus protocol, additional pins are required to control the external CODEC. CODECs that use an L3 control bus require 3 signals: L3_CLK, L3_DATA, and L3_MODE for writing bytes into the L3 bus register. The AIC supports the L3 bus protocol via software control of the general-purpose I/O (GPIO) pins. The AIC does not provide hardware control for the L3 bus protocol.

To control the internal CODEC, internal CODEC Spec can be referenced.

This chapter describes the programming model for the AIC. The information in this chapter requires an understanding of the AC'97 specification, Revision 2.3.

17.1.1 Block Diagram

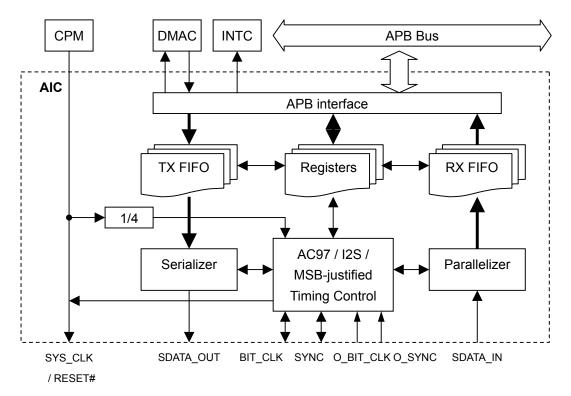

Figure 17-1 AIC Block Diagram

The O BIT CLK and O SYNC ports are only used by inter CODEC.

17.1.2 Features

AIC support following AC97/I2S features:

- 8, 16, 18, 20 and 24 bit audio sample data sizes supported
- DMA transfer mode supported
- Stop serial clock supported
- Programmable Interrupt function supported
- Support mono PCM data to stereo PCM data expansion on audio play back
- Support endian switch on 16-bits audio samples play back
- Support variable sample rate in AC-link format
- Multiple channel output and double rated supported for AC-link format
- Power Down Mode and two Wake-Up modes Supported for AC-link format
- Internal programmable or external serial clock and optional system clock supported for I2S or MSB-Justified format
- Internal I2S CODEC supported
- Two FIFOs for transmit and receive respectively with 32 samples capacity in every direction.

17.1.3 Interface Diagram

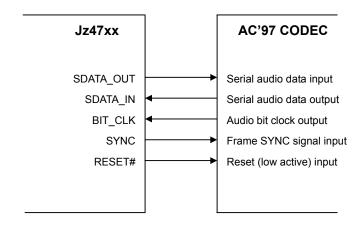

Figure 17-2 Interface to an External AC'97 CODEC Diagram

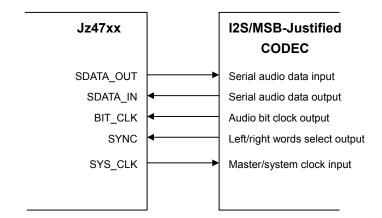

Figure 17-3 Interface to an External Master Mode I2S/MSB-Justified CODEC Diagram

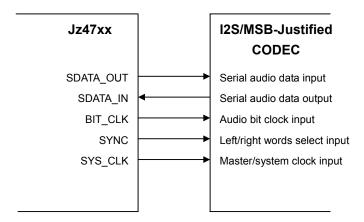

Figure 17-4 Interface to an External Slave Mode I2S/MSB-Justified CODEC Diagram

Please refer to the related CODEC specification for AIC Interface to the Internal CODEC Diagram

17.1.4 Signal Descriptions

There are all 5 pins used to connect between AIC and an external audio CODEC device. If an internal CODEC is used, these pins are not needed. Please refer to Chip Spec. They are listed and described in Table 17-1.

I/O **Description** Name **RESET#** RESET#: AC-link format, active-low CODEC reset. 0 SYS_CLK SYS_CLK: I2S/MSB-Justified formats, supply system clock to CODEC ı 12.288 MHz bit-rate clock input for AC-link, and sample rate dependent BIT_CLK I/O bit-rate clock input/output for I2S/MSB-Jistified. 0 48-kHz frame indicator and synchronizer for AC-link format SYNC I/O Indicates the left- or right-channel for I2S/MSB-Justified format Serial audio output data to CODEC SDATA_OUT SDATA_IN Serial audio input data from CODEC

Table 17-1 AIC Pins Description

The O_BIT_CLK and O_SYNC signals are not connected to any pin for only using by internal CODEC.

17.1.5 RESET#/SYS CLK Pin

RESET# is AC97 active-low CODEC reset, which outputs to CODEC. The CODEC's registers are reset when this RESET# is asserted. This pin is useful only in AC-link format. If AIC is disabled, it retains the high.

SYS_CLK outputs the system clock to CODEC. This pin is useful only in I2S/MSB-justified format. It generates a frequency between approximately 2.048 MHz and 24.576 MHz by dividing down the PLL clock with a programmable divisor. This frequency can be 256, 384, 512 and etc. times of the audio sampling frequency. Or it can be set to a wanted frequency. If AIC is disabled, it retains the high.

17.1.6 BIT CLK Pin

BIT_CLK is the serial data bit rate clock, at which AC97/I2S data moves between the CODEC and the processor. One bit of the serial data is transmitted or received each BIT_CLK period. It is fixed to 12.288 MHz in AC-link format, which inputs from the CODEC. In I2S and MSB-justified format it inputs from the CODEC in slave mode and outputs to CODEC in master mode. In the master mode, the clock is generated internally that is 64 times the sampling frequency. Table 17-7 lists the available sampling frequencies based on an internal clock source. If AIC is disabled, AICFR.AUSEL and AICFR.BCKD determine the direction. And it retains the low if it is output and the state is undefined if it is input.

17.1.7 SYNC Pin

In AC-link format, SYNC provides frame synchronization, fixed to 48kHz, by specifying beginning of an audio sample frame and outputs to CODEC. In I2S/MSB-Justified formats, SYNC is used to indicate left- or right-channel sample data and toggled in sample rate frequency. It outputs to CODEC in master mode and inputs from CODEC in slave mode. If AIC is disabled, AICFR.AUSEL and AICFR.BCKD determine the direction. And it retains the low if it is output and the state is undefined if it is input.

17.1.8 SDATA_OUT Pin

SDATA_OUT is AIC output data pin, which outputs serial audio data or data of AC97 CODEC register control to an external audio CODEC device. If AIC is disabled, it retains the low.

17.1.9 SDATA IN Pin

SDATA_IN is AIC inputs data pin, which inputs serial audio data or data of AC97 CODEC register status from an external audio CODEC device. If AIC is disabled, its state is undefined.

17.2 Register Descriptions

AIC software interface includes 13 registers and 1 FIFO data port. They are mapped in IO memory address space so that program can access them to control the operation of AIC and the outside CODEC.

Table 17-2 AIC Registers Description

Name	Description	RW	Reset value	Address	Size
AICFR	AIC Configuration Register	RW	0x00007800	0x10020000	32

CKCFG	Clock Configure for the embedded CODEC to AIC	RW	0x00000000 0x00000002	0x100200A0	32
RGADW	Address, data in and write command for accessing to internal registers of embedded CODEC	RW	0x00000000	0x100200A4	32
RGDAT.	The read out data and interrupt request status of Internal registers data in the embedded CODEC.	R	0x00000000	0x100200A8	32

^{1.} AICFR is used to control FIFO threshold, AC-link or I2S/MSB-justified selection, AIC reset, master/slave selection, and AIC enable.

^{2.} AICCR is used to control DMA mode, FIFO flush, interrupt enable, internal loop-back, play back

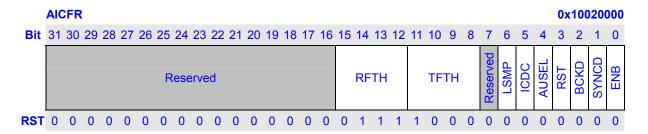

- and recording enable. It also controls sample size and signed/unsigned data transfer.
- 3. ACCR1 is used to reflect/control valid incoming/outgoing slots of AC97.
- 4. ACCR2 is used to control interrupt enable, output/input sample size, and alternative control of RESET#, SYNC and SDATA_OUT pins in AC-link.
- 5. I2SCR is used to control BIT_CLK stop, audio sample size, I2S or MSB-justified selection in I2S/MSB-justified.
- 6. AICSR is used to reflect FIFOs status
- 7. ACSR is used to reflect the status of the connected external CODEC in AC-link.
- 8. I2SSR is used to reflect AIC status in I2S/MSB-justified.
- 9. ACCAR and ACCDR are used to hold address and data for AC-link CODEC register read/write.
- 10. ACSAR and ACSDR are used to receive AC-link CODEC registers address and data
- 11. I2SDIV is used to set clock divider for BIT_CLK generating in I2S/MSB-justified format.
- 12. AICDR is act as data input/output port to/from transmit/receive FIFO when write/read.
- CKCFG, RGADW and RGDATA are used to access internal CODEC, please refer to <u>CODEC</u> <u>Spec</u>.

17.2.1 AIC Configuration Register (AICFR)

AICFR contains bits to control FIFO threshold, AC-link or I2S/MSB-justified selection, AIC reset, master/slave selection, and AIC enable.

Bits	Name											
31:16	Reserved	Writes to these bits	have no effect and always read as 0	R								
15:12	RFTH	Receive FIFO three	shold for interrupt or DMA request. The RFTH valid	RW								
		value is 0 ~ 15.										
		This value represer	nts a threshold value of (RFTH + 1) * 2. When the									
		sample number in r	eceive FIFO, indicated by AICSR.RFL, is great than or									
		equal to the thresh	old value, AICSR.RFS is set. Larger RFTH value									
		provides lower DM/	A/interrupt request frequency but have more risk to									
		involve receive FIF	O overflow. The optimum value is system dependent.									
11:8	TFTH	Transmit FIFO thre	shold for interrupt or DMA request. The TFTH valid	RW								
		value 0 ~ 15.										
		This value represer	nts a threshold value of TFTH * 2. When the sample									
		number in transmit	FIFO, indicated by AICSR.TFL, is less than or equal to									
		the threshold value	, AICSR.TFS is set. Smaller TFTH value provides									
		lower DMA/interrup	t request frequency but have more risk to involve									
		transmit FIFO unde	erflow. The optimum value is system dependent.									
7	Reserved	Writes to these bits	have no effect and always read as 0	R								
6	LSMP	Select between pla	y last sample or play ZERO sample in TX FIFO	RW								
		underflow. ZERO s	ample means sample value is zero. This bit is better									
		be changed while a	udio replay is stopped.									
		LSMP	CODEC used									
		0	Play ZERO sample when TX FIFO underflow									
		1	Play last sample when TX FIFO underflow									
5	ICDC	Internal CODEC us	ed. Select between internal or external CODEC.	RW								
		ICDC	CODEC used									
		0	External CODEC									
		1	Internal CODEC									
4	AUSEL	Audio Unit Select. S	Select between AC-link and I2S/MSB-justified. Change	RW								
		this bit in case of B	IT_CLK is stopped (I2SCR.STPBK = 1)									

		AUSEL	Selected									
		0	Select AC-link format									
		1	Select I2S/MSB-justified format									
3	RST	Reset AIC. Write 1	to this bit reset AIC registers and FIFOs except AICFR	W								
		and I2SDIV registe	er. Writing 0 to this bit has no effect and this bit is									
		always reading 0.										
2	BCKD	BIT_CLK Direction	. This bit specifies input/output direction of BIT_CLK. It	RW								
		is only valid in I2S/	MSB-justified format. When AC-link format is selected,									
		BIT_CLK is always	SIT_CLK is always input and this bit is ignored. Change this bit in case of									
		BIT_CLK is stoppe	BIT_CLK is stopped (I2SCR.STPBK = 1)									
		BCKD	BIT_CLK Direction									
		0										
		1	BIT_CLK is generated internally and driven out to									
			the CODEC.									
1	SYNCD	SYNC Direction. T	his bit specifies input/output direction of SYNC in	RW								
		I2S/MSB-justified f	ormat. When AC-link format is selected, SYNC is									
		always output and	this bit is ignored. Change this bit in case of BIT_CLK is									
		stopped (I2SCR.S	TPBK = 1)									
		SYNCD	SYNC Direction									
		0	SYNC is input from an external source.									
		1	SYNC is generated internally and driven out to the									
			CODEC.									
0	ENB	Enable AIC functio	n. This bit is used to enable or disable the AIC function.	RW								
		ENB	Description									
		0	Disable AIC Controller									
		1	Enable AIC Controller									

The BCKD bit (bit 2) and SYNCD bit (bit 1) configure the mode of I2S/MSB-justified interface. This is compliant with I2S specification.

BCKD	SYNCD	Description
	0 (input)	AIC roles the slave of I2S/MSB-justified interface.
0 (input)	1 (output)	AIC roles the master with external serial clock source of I2S/MSB-justified interface.
1 (output)	0 (input)	Reserved
1 (output)	1 (output)	AIC roles the master of I2S/MSB-justified interface

17.2.2 AIC Common Control Register (AICCR)

AICCR contains bits to control DMA mode, FIFO flush, interrupt enable, internal loop-back, play back and recording enable. It also controls sample size and signed/unsigned data transfer.

		receivi	ng audio data.										
			RDMS	Receive DMA									
			0	Disabled									
		1 Enabled											

14	TDMS	Transmit DMA enable. This bit is used to enable or disable the DMA	RW
		during transmit audio data.	
		TDMS Transmit DMA	
		0 Disabled	
		1 Enabled	
13:12	Reserved	Writes to these bits have no effect and always read as 0	R
11	M2S	Mono To Stereo. This bit control whether to do mono to stereo sample	RW
		expansion in play back. When this bit is set, every outgoing sample data	
		in the steam plays in both left and right channels. This bit should only be	
		set in 2 channels configuration. It takes effective immediately when the bit	
		is changed. Change this before replay started	
		M2S Description	
		0 No mono to stereo	
		expansion	
		1 Do mono to stereo	
		expansion	
10	ENDSW	Endian Switch. This bit control endian change on outgoing 16-bits size	RW
		audio sample by swapping high and low bytes in the sample data.	
		ENDSW Description	
		0 No change on outgoing sample	
		data	
		1 Swap high and low byte for	
		outgoing 16-bits size sample data	
9	ASVTSU	Audio Sample Value Transfer between Signed and Unsigned data format.	RW
		This bit is used to control the signed ←→unsigned data transfer. If it is 1,	
		the incoming and outgoing audio sample data will be transferred by toggle	
		its most significant bit.	
		ASVTSU Description	
		0 No audio sample value signed ←→unsigned	
		transfer	
		Do audio sample value signed ←→unsigned	
		transfer

Bits	Name			Description		RW									
31:26	Reserved	Write	s to these bits h	ave no effect and always read as 0		R									
25:16	RS	Rece	ive Valid Slots. ⁻	These bits are used to indicate which ir	ncoming slots	RW									
		are va	alid. Slot 3 is ma	apped to bit 16 or RS[0], slot 4 to bit 17	or RS[1] and										
		so on	. When write to	this field, a bit 1 means we expect a PC	M data in the										
		corre	sponding slot, a	bit 0 means the corresponding slot PCI	M data will be										
		disca	rded. When rea	d from this field, a bit 1 means we rece	ive an										
		expe	cted valid PCM	data in the corresponding slot. This field	d should be										
		writte	n before record	started.	_										
			RS[n] Value Description												
			0 Slot n+3 is invalid.												
			1 Slot n+3 has valid PCM data.												
15:10	Reserved	Write	Writes to these bits have no effect and always read as 0												
9:0	XS	Trans	mit Valid Slots.	These bits making up slots map to the	valid bits in	RW									
		the A	C'97 tag (slot 0	on SDATA_OUT) and indicate which o	utgoing slots										
		have	valid PCM data.	. Bit 0 or XS[0] maps to slot 3, bit 1 or X	(S[1] to slot 4										
		and s	o on. Setting the	e corresponding bit indicates to AIC to t	take an audio										
		samp	le from transmit	FIFO to fill the respective slot. And it in	ndicates to										
		the C	ODEC that valid	I PCM data will be in the respective slot	. The number										
		of val	id bits will desig	nate how many words will be pulled ou	t of the FIFO										
		per a	udio frame. This	s field should be written before record a	ind replay										
		starte	started.												
			XS[n] Value Description												
			0 Slot n+3 is invalid.												
		1 Slot n+3 has valid PCM data.													

17.2.4 AIC AC-link Control Register 2 (ACCR2)

ACCR2 contains bits to control interrupt enable, output/input sample size, and alternative control of RESET#, SYNC and SDATA_OUT pins in AC-link. It is valid only in AC-link format.

	AC	CR	2																										0x	100	200	00C

17.2.5 AIC I2S/MSB-justified Control Register (I2SCR)

I2SCR contains bits to control BIT_CLK stop, audio sample size, I2S or MSB-justified selection in I2S/MSB-justified. It is valid only in I2S/MSB-justified format.

Bits	Name		Description												
31:13	Reserved	Writes	to these bits h	nave no effect and always read as	s 0	R									
12	STPBK	Stop B	IT_CLK. It is u	sed to stop the BIT_CLK in I2S/M	ISB-justified format.	RW									
		When A	AC-link is sele	ected, all of its operations are igno	ored.										
			STPBK	Description											
			0	BIT_CLK is not stopped											
			1 BIT_CLK is stopped												
		Please	Please set this bit to 1 to stop BIT_CLK when change AICFR.AUSEL and												
		AICFR	.BCKD												
11:5	Reserved	Writes	to these bits h	nave no effect and always read as	s 0	R									
4	ESCLK	Enable	SYSCLK out	put. When this bit is 1, the SYSC	LK outputs to chip	RW									
		outside	e is enabled. E	Else, the clock is disabled.											
0	AMSL	Specify	/ Alternate Mo	ode (I2S or MSB-Justified) Operat	tion.	RW									
		AMSL Description													
			0	Select I2S Operation Mode											
		1 Select MSB-Justified Operation Mode													

17.2.6 AIC Controller FIFO Status Register (AICSR)

AICSR contains bits to reflect FIFOs status. Most of the bits are read-only except two, which can be written a 0.

	AIC	SR																											0x	100	200)14
Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Bits	Name		Description Writes to these bits have no effect and always read as 0												
31:30	Reserved	Writes	to these	bits hav	ve no effect and always read as 0		R								
29:24	RFL	Receiv	e FIFO	Level. Ti	he bits indicate the amount of valid PCM data in	1	R								
		Receiv	e FIFO.												
			RFL '	Value	Description										
			0x00 ~	0x20	RFL valid PCM data in receive FIFO										
			0x21 ~	0x3F	Reserved										
23:14	Reserved	Writes	to these	bits hav	ve no effect and always read as 0		R								
13:8	TFL	Transr	nit FIFO	Level. T	he bits indicate the amount of valid PCM data i	n	R								
		Transr	nit FIFO	-											
			TFL	Value	Description										
			0x00 ~	0x20	TFL valid PCM data in transmit FIFO										
			0x21 ~	0x3F	Reserved										
7	Reserved	Writes	rites to these bits have no effect and always read as 0												
6	ROR	Receiv	eceive FIFO Over Run. This bit indicates that receive FIFO has or has												
		not exp	perience	d an ove	errun.	_									
			ROR		Description										
		0		When	read, indicates over-run has not been found										
				When	write, clear itself										
				When	read, indicates data has even been written to										
		1		full rec	eive FIFO										
			When write, not effects												
5	TUR	Transr	mit FIFO Under Run. This bit indicates that transmit FIFO has or has												
		not exp	perienced an under-run.												
			TUR		Description										
		0		When	read, indicates under-run has not been found										
				When	write, clear itself										
				When	read, indicates data has even been read from										
		1		empty	transmit FIFO										

		When write, not effects											
4	RFS	Receiv	e FIFO Se	ervice Request. This bit indicates that receive FIF0) level	R							
		is or no	ot below re	eceive FIFO threshold, which is controlled by									
		AICFR	.RFTH. W	hen RFS is 1, it may trigger interrupt or DMA requ	est								
		depend	ds on the i	nterrupt enable and DMA setting.									
			RFS	Description									
			0 Receive FIFO level below RFL threshold										
			Receive FIFO level at or above RFL threshold										
3	TFS	Transn	Transmit FIFO Service Request. This bit indicates that transmit FIFO level										
		is belo	w Transm	it FIFO threshold, which is controlled by AICFR.TF	TH.								
		When	TFS is 1, i	t may trigger interrupt or DMA request depends or	n the								
		interru	ot enable	and DMA setting.									
			TFS Description										
		0 Transmit FIFO level exceeds TFL threshold											
			1	Transmit FIFO level at or below TFL threshold									
2:0	Reserved	Writes to these bits have no effect and always read as 0											

17.2.7 AIC AC-link Status Register (ACSR)

ACSR contains bits to reflect the status of the connected external CODEC in AC-link format. Bits in this register are read-only in general, except some of them can be written a 0.

	AC	SR																											0x	100	200	18
Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
											RR	Y	1	0	2																	
	Reserved										빝	RD), LPI	STC	ADF	ÄD.							R	ese	rve	d						
											S	0	0	ш	0)	U																
RST	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bits	Name	Description Writes to these bits have no effect and always read as 0														
31:22	Reserved	Writes	to these bits	have no effect and always read as 0	R											
21	SLTERR	Hardw	vare detects a	Slot Error. This bit indicates an error in SLOTREQ bits	RW											
		on inc	oming data fro	om external CODEC is detected. The error can be: (1)												
		find 1	in a SLOTRE	Q bit, which corresponding to an inactive slot; (2) all												
		active	slots should b	pe request in the same time by SLOTREQ, but an												
		ехсер	tion is found.	All errors are accumulated to ACSR.SLTERR by												
		hardw	are until softw	rare clears it. Software writes 0 clear this bit and write												
		1 has	no effect.													
20	CRDY	Exterr	nal CODEC Re	eady. This bit is derived from the CODEC Ready bit of	R											
		Slot 0	in SDATA_IN	, and it indicates the external AC97 CODEC is ready												
		or not	or not.													
			CRDY Description													
			0 CODEC is not ready													
			1	CODEC is ready												
19	CLPM	Exterr	nal CODEC Lo	w Power Mode. This bit indicates the external	R											
		CODE	EC is switched	to low power mode or BIT_CLK is active from												
		CODE	C after wake	up.												
			CLPM	Description												
			0	BIT_CLK is active												
			1	CODEC is switched to low power mode												
18	RSTO	Exterr	nal CODEC R	egisters Read Status Time Out. This bit indicates that	RW											
		the re	ad status time	out is detected or not. It is set to 1 if the data not												
		return in 4 frames after a CODEC registers read command issued.														
		RSTO Description														
		0 When read, indicates time out has not occurred														
			1	When read, indicates read status time out found												
		Write	0 clear this bit	and write 1 is ignored. When RSTO is 1, it may												
		trigger an interrupt depends on the interrupt enable setting.														

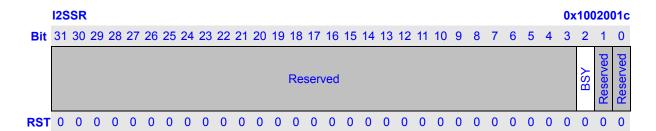

17	SADR	Exte	rnal CODEC	Registers Status Address and Data Received. This bit	RW										
		indic	ates that ad	dress and data of an external AC '97 CODEC register											
		has	or has not be	een received.											
			SADR	Description											
			0	When read, indicates no register address/data											
				received.											
			1	When read, indicates address/data received.											
		Write 0 clear this bit and write 1 is ignored. When SADR is 1, it may													
		trigg	trigger an interrupt depends on the interrupt enable setting.												
16	CADT	Com	mand Addre	ess and Data Transmitted. This bit indicates that a	RW										
		COD	EC register	reading/writing command transmission has completed or											
		not.													
			CADT	Description											
			0	When read, indicates the command has not done.											
		1 When read, indicates the command has done.													
		Write 0 clear this bit and write 1 is ignored. When CADT is 1, it may													
		trigg	er an interru	pt depends on the interrupt enable setting.											
15:0	Reserved	Writes to these bits have no effect and always read as 0													

17.2.8 AIC I2S/MSB-justified Status Register (I2SSR)

I2SSR is used to reflect AIC status in I2S/MSB-justified. It is a read-only register.

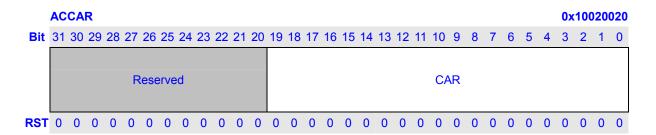

Bits	Name		Description	RW										
31:3	Reserved	Writes to th	nese bits have no effect and always read as 0	R										
2	BSY	AIC busy ir	busy in I2S/MSB-justified format.											
		BSY												
		0	AIC controller is idle or disabled											
		1	1 AIC controller currently is transmitting or receiving a frame											
1:0	Reserved	Writes to th	Writes to these bits have no effect and always read as 0											

17.2.9 AIC AC97 CODEC Command Address Register (ACCAR) & Data Register (ACCDR)

ACCAR and ACCDR are used to hold register address and data for external AC-link CODEC register read/write operation through SDATA_OUT. The format of ACCAR.CAR and ACCDR.CDR is compliant with AC'97 Component Specification 2.3 where ACCAR.CAR[19] of "1" specifies CODEC register read operation, of "0" specifies CODEC register write operation. The write access to ACCAR and ACCDR signals AIC to issue this operation. Please reference to 17.4.4 for software flow. These registers are valid only in AC-link. It is ignored in I2S/MSB-justified format.

Bits	Name	Description	RW
31:20	Reserved	Writes to these bits have no effect and always read as 0	R
19:0	CAR	Command Address Register. This is used to hold 20-bit AC '97 CODEC	RW
		register address transmitted in SDATA_OUT slot 1. After this field is	
		write, it should not be write again until the operation is finished.	

	AC	CD	R																										0x	100	200	24
Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	Reserved																				CE	PR										
RST	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bits	Name	Description	RW
31:20	Reserved	Writes to these bits have no effect and always read as 0	R
19:0	CDR	Command Data Register. This is used to hold 20-bit AC'97 CODEC	RW
		register data transmitted in SDATA_OUT slot 2. After this field is write, it	
		should not be write again until the operation is finished.	

17.2.10 AIC AC97 CODEC Status Address Register (ACSAR) & Data Register (ACSDR)

ACSAR and ACSDR are used to receive the external AC-link CODEC registers address and data from SDATA_IN. When AIC receives CODEC register status from SDATA_IN, it set ACSR.SADR bit and put the address and data to ACSAR.SAR and ACSDR.SDR. Please reference to 17.4.4 for software flow. These registers are valid only in AC-link format and are ignored in I2S/MSB-justified format.

Bits	Name	Description	RW
31:20	Reserved	Writes to these bits have no effect and always read as 0	R
19:0	SAR	CODEC Status Address Register. This is used to receive 20-bit AC '97	R
		CODEC status address from SDATA_IN slot 1. Which reflect the register	
		index for which data is being returned. The write operation is ignored.	

	AC	SD	R																										0x	100	200	2C
Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
					R	ese	erve	d														SE)R									
DOT	Λ	Λ	Λ	Λ	Λ	Λ	Λ	Λ	Λ	Λ	Λ	Λ	Λ	Λ	Λ	Λ	Λ	Λ	Λ	Λ	Λ	Λ	Λ	Λ	Λ	Λ	Λ	Λ	Λ	Λ	Λ	0

Bits	Name	Description	RW
31:20	Reserved	Writes to these bits have no effect and always read as 0	R
19:0	SDR	CODEC Status Data Register. This is used to receive 20-bit AC '97	R
		CODEC status data from SDATA_IN slot 2. The register data of external	
		CODEC is returned. The write operation is ignored.	

17.2.11 AIC I2S/MSB-justified Clock Divider Register (I2SDIV)

I2SDIV is used to set clock divider to generated BIT_CLK from SYS_CLK in I2S/MSB-justified format.

Bits	Name	Description	RW
31:4	Reserved	Writes to these bits have no effect and always read as 0	R
3:0	DV	Audio BIT_CLK clock divider value minus 1. I2SDIV.DV is used to control	RW
		the generating of BIT_CLK from dividing SYS_CLK. The dividing value	
		should be even and I2SDIV.DV should be set to the dividing value minus	
		1. So I2SDIV.DV bit0 is fixed to 1. BIT_CLK frequency is fixed to 64 $f_{\rm S}$ in	
		AIC, where f _S is the audio sample frequency. I2SDIV.DV depends on	
		SYS_CLK frequency f _{SYS_CLK} , which is selected according to external	
		CODEC's requirement and internal PLL frequency. Please reference to	
		17.4.9 "Serial Audio Clocks and Sampling Frequencies" for further	
		description.	

17.2.12 AIC FIFO Data Port Register (AICDR)

AICDR is act as data input port to transmit FIFO when write and data output port from receive FIFO when read, one audio sample every time. The FIFO width is 24 bits. Audio sample with size N that is less than 24 is located in LSB N-bits. The sample size is specified by ACCR2.OASS and ACCR2.IASS in AC-link, and by I2SCR.WL in I2S/MSB-justified. The sample order is specified by ACCR1.XS and ACCR1.RS in AC-link. In I2S/MSB-justified, the left channel sample is prior to the right channel sample.

Care should be taken to monitor the status register to insure that there is room for data in the FIFO when executing a program read or write transaction. This is taken care automatically in DMA.

	AIC	DR																											0x	100	200	34

Bits	Name	Description	RW
31:24	Reserved	Writes to these bits have no effect and always read as 0	R
23:0	DATA	FIFO port. When write to it, data is push to the transmit FIFO. When read	RW
		from it, data is pop from the receiving FIFO.	

17.3 Serial Interface Protocol

17.3.1 AC-link serial data format

Following figures are AC-link serial data format. Audio data is MSB adjusted, regardless of 8, 16, 18, 20, 24 bits sample size. When a 24-bits sample is transmitted, the LSB 4-bits are truncated. When try to record 24-bits sample, 4-bits of 0 are appended in LSB. Please reference to "AC '97 Component Specification Revision 2.3, 2002", provided by Intel Corporation, for details of AC '97 architecture and AC-link specification.

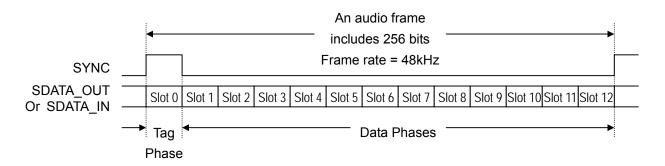

Figure 17-5 AC-link audio frame format

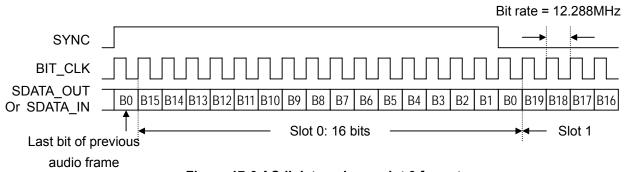

Figure 17-6 AC-link tag phase, slot 0 format

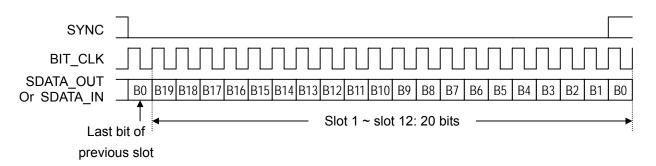

Figure 17-7 AC-link data phases, slot 1 ~ slot 12 format

17.3.2 I2S and MSB-justified serial audio format

Normal I2S and MSB-justified are similar protocols for digitized stereo audio transmitted over a serial path.

The BIT_CLK supplies the serial audio bit rate, the basis for the external CODEC bit-sampling logic. Its frequency is 64 times the audio sampling frequency. Divided by 64, the resulting 8 kHz to 48 kHz or even higher signal signifies timing for left and right serial data samples passing on the serial data paths. This left/right signal is sent to the CODEC on the SYNC pin. Each phase of the left/right signal is accompanied by one serial audio data sample on the data pins SDATA IN and SDATA OUT.

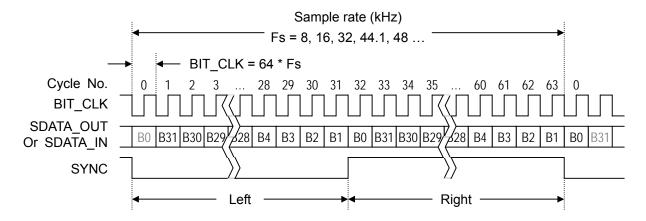

Figure 17-8 I2S data format

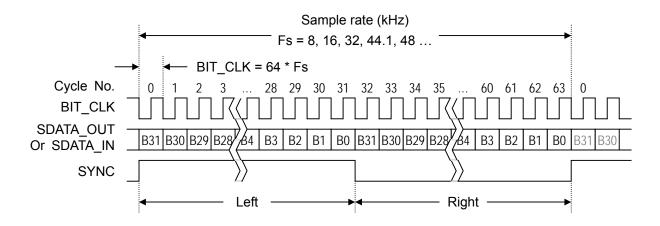

Figure 17-9 MSB-justified data format

Figure 17-8 and Figure 17-9 provide timing diagrams that show formats for the normal I2S and MSB-justified modes of operations. Data is sampled on the rising edge of the BIT_CLK and data is sent out on the falling edge of the BIT_CLK.

Data is transmitted and received in frames of 64 BIT_CLK cycles. Each frame consists of a left sample and a right sample. Each sample holds 8, 16, 18, 20 or 24 bits of valid data. The LSB other bits of each sample is padded with zeroes.

- In the normal I2S mode, the SYNC is low for the left sample and high for the right sample. Also, the MSB of each data sample lags behind the SYNC edges by one BIT CLK cycle.
- In the MSB-justified mode, the SYNC is high for the left sample and low for the right sample. Also, the MSB of each data sample is aligned with the SYNC edges.

When use with the internal CODEC, the BIT_CLK and SYNC signals also with O_BIT_CLK and O_SYNC signals are provided by the internal CODEC from the SYSCLK, which is enabled by I2SCR.ESCLK and configured to 12MHz clock using CPM.

17.3.3 Audio sample data placement in SDATA_IN/SDATA_OUT

The placement of audio sample in incoming/outgoing serial data stream for all formats support in AIC is MSB (Most Significant Bit) justified. Suppose n bit sample composed by

Table 17-3 described the how sample data bits are transferred.

Table 17-3 Sample data bit relate to SDATA_IN/SDATA_OUT bit

17.4 Operation

The AIC can be accessed either by the processor using programmed I/O instructions or by the DMA controller. The processor uses programmed I/O instructions to access the AIC and can access the following types of data

- The AIC memory mapped registers data—All registers are 32 bits wide and are aligned to word boundaries.
- AIC controller FIFO data—An entry is placed into the transmit FIFO by writing to the I2S
 controller's Serial Audio Data register (AICDR). Writing to AICDR updates a transmit FIFO entry.
 Reading AICDR flushes out a receive FIFO entry.
- The external CODEC registers for I2S CODEC—CODEC registers can be accessed through the L3 bus. The L3 bus operation is emulated by software controlling three GPIO pins.
- The external CODEC registers for AC97 CODEC—An AC97 audio CODEC can contain up to sixty-four 16-bit registers. A CODEC uses a 16-bit address boundary for registers. The AIC supplies access to the CODEC registers through several registers.
- The internal CODEC registers can be accessed via memory mapped registers in the CODEC.

The DMA controller can only access the FIFOs. Accesses are made through the data registers, as explained in the previous paragraph. The DMA controller responds to the following DMA requests made by the I2S controller:

- The transmit FIFO request is based on the transmit trigger-threshold (AICFR.TFTH) setting.
 See 17.2.1 for further details regarding AICFR.TFTH.
- The receive FIFO request is based on the receive trigger-threshold (AICFR.RFTH) setting. See 17.2.1 for further details regarding AICFR.RFTH.

Before operation to AIC, you may need to set proper PIN function selection from GPIO using if the pin is shared with GPIO.

Please also reference to "AC '97 Component Specification Revision 2.3, 2002" when deal with AIC AC-link operations.

17.4.1 Initialization

At power-on or other hardware reset (WDT and etc), AIC is disabled. Software must initiate AIC and the internal or external CODEC after power-on or reset. If errors found in data transferring, or in other places, software must initial AIC and optional, the internal or external CODEC. Here is the initial flow.

- 1. Select internal or external CODEC (AICFR.ICDC).
- 2. If external CODEC is selected, select AC-link or I2S/MSB-Justified (AICFR.AUSEL). If internal CODEC is used, select I2S/MSB-Justified format (AICFR.AUSEL=1). If the resettlement without involving link format and architecture changing, this step can be skip.
- 3. If I2S/MSB-Justified is selected, select between I2S and MSB-Justified (I2SCR.AMSL), decide BIT_CLK direction (AICFR.BCKD) and SYNC direction (AICFR.SYNCD). If BIT_CLK is configured as output, BIT_CLK divider I2SDIV.DV must be set to what correspond with the values as shown in Table 17-7. And the clock selection and the divider between PLL clock out and AIC also must be set (CFCR.I2S and I2SCDR in CPM). If internal CODEC is used, select 12MHz clock input (via set proper value in CFCR.I2S and I2SCDR), I2S format (I2SCR.AMSL=0), input BIT_CLK (AICFR.BCKD=0), input SYNC (AICFR.SYNCD=0).
- 4. Enable AIC by write 1 to AICFR.ENB
- 5. If it needs to reset AIC registers and flush FIFOs, write 1 to AICFR.RST. If it need only flush FIFOs, write 1 to AICCR.FLUSH. BIT CLK must exist here and after.
- 6. In AC-link format, issue a warm or cold CODEC reset.
- 7. In AC-link format, configure AC '97 CODEC via ACCAR and ACCDR registers. If the resettlement doesn't involving AC'97 CODEC registers changing, this step can be skip.
- 8. In case of external CODEC with I2S/MSB-Justified format, configure I2S/MSB-justified CODEC via the control bus connected to the CODEC, for instance I2C or L3, depends on CODEC. In case of internal CODEC, configure CODEC via CODEC's memory mapped registers. If the resettlement without involving I2S/MSB-justified CODEC or ADC/DAC function changing, this step can be skip.

17.4.2 AC '97 CODEC Power Down

AC '97 CODEC can be placed in a low power mode. When the CODEC's power-down register (26h), is programmed to the appropriate value, the CODEC will be put in a low power mode and both BIT_CLK and SDATA_IN will be brought to and held at a logic low voltage level.

Once powered down, re-activation of the AC-link via re-assertion of the SYNC signal must not occur for a minimum of four audio frame times following the frame in which the power down was triggered. When AC-link powers up it indicates readiness via the CODEC Ready bit (input slot 0, bit 15).

17.4.3 Cold and Warm AC '97 CODEC Reset

AC-link reset operations occur when the system is initially powered up, when resuming from a lower powered sleep state, and in response to critical subsystem failures that can only be recovered from with a reset.

17.4.3.1 Cold AC '97 CODEC Reset

A cold reset is achieved by asserting RESET# for the minimum specified time. By driving RESET# low, BIT_CLK, and SDATA_IN will be activated, or re-activated as the case may be, and all AC '97 CODEC registers will be initialized to their default power on reset values.

RESET# is an asynchronous AC '97 CODEC input.

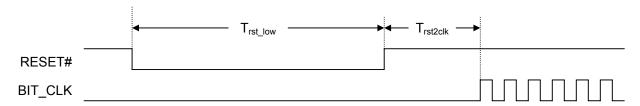

Figure 17-10 Cold AC '97 CODEC Reset Timing

Table 17-4 Cold AC '97 CODEC Reset Timing parameters

Parameter	Symbol	Min	Туре	Max	Units
RESET# active low pulse width	T _{rst_low}	1.0	-	-	μs
RESET# inactive to BIT_CLK startup delay	T _{rst2clk}	162.8	-	-	ns

17.4.3.2 Warm AC '97 CODEC Reset

A warm AC'97 reset will re-activate the AC-link without altering the current AC'97 register values. Driving SYNC high for a minimum of 1 µs in the absence of BIT_CLK signals a warm reset.

Within normal audio frames SYNC is a synchronous AC '97 CODEC input. However, in the absence of BIT_CLK, SYNC is treated as an asynchronous input used in the generation of a warm reset to AC '97 CODEC.

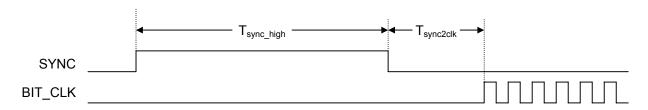

Figure 17-11 Warm AC '97 CODEC Reset Timing

Table 17-5 Warm AC '97 CODEC Reset Timing Parameters

Parameter	Symbol	Min	Туре	Max	Units
SYNC active high pulse width	T _{sync_high}	1.0	-	-	Ms
SYNC inactive to BIT_CLK startup delay	T _{sync2clk}	162.8	-	-	Ns

17.4.4 External CODEC Registers Access Operation

The external audio CODEC can be configured/controlled by its internal registers. To access these registers, an I2S/MSB-justified CODEC usually employs L3 bus, SPI bus, I2C bus or other control bus. The L3 bus operation can be emulated by software by using 3 GPIO pins of the chip. For AC '97, "AC '97 Component Specification" defines the CODEC register access protocol. Several registers are provided in AIC to accomplish this task.

The ACCAR and ACCDR are used to send a register accessing request command to external AC'97 CODEC. The ACSAR and ACSDR are used to receive a register's content from external AC'97 CODEC. The register accessing request and the register's content returning is asynchronous.

The AC'97 CODEC register accessing request flow:

- 2. If ACSR.CADT is 0, wait for 25.4µs. If no previous accessing request, this step can be skip.
- 3. Clear ACSR.CADT.
- 4. If read access, write read-command and register address to ACCAR, if write access, write write-command and register address to ACCAR and write data to ACCDR. Any order of write ACCAR and ACCDR is OK.
- 5. Polling for ACSR.CADT changing to 1, which means the request has been send to CODEC via AC-link.

The AC'97 CODEC register content receiving flow by polling:

- 4. Polling for ACSR.SADR changing to 1
- 5. Read the CODEC register's address from ACSAR and content from ACSDR
- 6. Clear ACSR.SADR

The AC'97 CODEC register content receiving flow by interrupt:

- (1) Before accessing request, clear ACSR.SADR and set ACCR2.ESADR.
- (2) Waiting for the interrupt. When the interrupt is found, check if ACSR.SADR is 1, if not, repeat this step again.
- (3) Read the CODEC register's address from ACSAR and content from ACSDR
- (4) Clear ACSR.SADR

17.4.5 Audio Replay

Outgoing audio sample data (from AIC to CODEC) is written to AIC transmit FIFO from processor via store instruction or from memory via DMA. AIC then takes the data from the FIFO, serializes it, and sends it over the serial wire SDATA_OUT to an external CODEC or over an internal wire to an internal CODEC.

The audio transmission is enabled automatically when the AIC is enabled by set AICFR.ENB. But all replay data is zero at this time except both of the following conditions are true:

- 1. AICCR.ERPL must be 1. If AICCR.ERPL is 0, value of zero is send to CODEC even if there are samples in transmit FIFO.
- 2. At least one audio sample data in the transmit FIFO. If the transmit FIFO is empty, value of zero or last sample depends on AICFR.LSMP, is send to CODEC even if AICCR.ERPL is 1.

Here is the audio replay flow:

- 1. Configure the CODEC as needed.
- 2. Configure sample size by AICCR.OSS
- Configure sample rate by clock dividers (for I2S/MSB-Justified format with BIT_CLK is provided internally) or by CODEC registers (for AC-link or BIT_CLK provided by external CODEC) or by accessing CODEC internal registers (for internal CODEC)
- 4. For AC-link, configure replay channels by ACCR1.XS
- 5. Some other configurations: mono to stereo, endian switch, signed/unsigned data transfer, transmit FIFO configuration, play ZERO or last sample when TX FIFO under-run, and etc.
- 6. Write 1 to AICCR.ERPL.
 - It is suggested that at least a frame of PCM data is pre-filled in the transmit FIFO to prevent FIFO under-run flag (AICSR.TUR).
 - But when using internal CODEC, write first frame of PCM data to transmit FIFO till TX FIFO under-run (AICSR.TUR is set to 1), otherwise left/right channel may be switched.
- 7. Fill sample data to the transmit FIFO. Repeat this till finish all sample data. In this procedure, please control the FIFO to make sure no FIFO under-run and other errors happen. When the transmit FIFO under-run, noise or pause may be heard in the audio replay, AICSR.TUR is 1, and if AICCR.ETUR is 1, AIC issues an interrupt. Please reference to 17.4.7 for detail description on FIFO.
- 8. Waiting for AICSR.TFL change to 0. So that all samples in the transmit FIFO has been replayed, then we can have a clean start up next time
- 9. Write 0 to AICCR.ERPL.

Note: Before replaying Open ADC BITCLK and close it to generating Record internal circuit reset when using internal CODEC.

17.4.6 Audio Record

Incoming audio sample data (from CODEC to AIC) is received from SDATA_IN (for an external CODEC) or an internal wire (for an internal CODEC) serially and converted to parallel word and stored in AIC receive FIFO. Then the data can be taken from the FIFO to processor via load instruction or to memory via DMA.

The audio recording is enabled automatically when the AIC is enabled by set AICFR.ENB. But all received data is discarded at this time except both of the following conditions are true:

- (1) AICCR.EREC must be 1. If AICCR.EREC is 0, the received data is discarded even if there are rooms in the receive FIFO.
- (2) At least one room left in the receive FIFO. If the receive FIFO is full, the received data is discarded even if AICCR.EREC is 1.

Here is the audio record flow:

- Configure the CODEC as needed.
- Configure sample size by AICCR.ISS
- Configure sample rate by clock dividers (for I2S/MSB-Justified format with BIT_CLK is provided internally) or by CODEC registers (for AC-link or BIT_CLK provided by external CODEC) or by CODEC memory mapped registers (for internal CODEC)
- Some other configurations: signed/unsigned data transfer, receive FIFO configuration, and etc.
- Write 1 to AICCR.EREC. Make sure there are rooms available in the receive FIFO before set AICCR.EREC. Usually, it should empty the receive FIFO by fetch data from it before set AICCR.EREC
- Take sample data form the receive FIFO. Repeat this till the audio finished. In this procedure, please control the FIFO to make sure no FIFO over-run and other errors happen. When the receive FIFO over-run, same recorded audio samples will be lost, AICSR.ROR is 1, and if AICCR.EROR is 1, AIC issues an interrupt. Please reference to 17.4.7 for detail description on FIFO. For AC-link, ACCR1.RS tells which channels are recorded.
 - When using internal CODEC, the first data should be ignored.
- Write 0 to AICCR.EREC.
- Take sample data from the receive FIFO until AICSR.RFL change to 0. So that all samples in the receive FIFO has been taken away, then we can have a clean start up next time. When the receive FIFO is empty, read from it returns zero.

17.4.7 FIFOs operation

AIC has two FIFOs, one for transmit audio sample and one for receive. All AIC played/recorded audio sample data is taken from/send to transmit/receive FIFOs. The FIFOs are in 24 bits width and 32 entries depth, one entry for keep one audio sample regardless of the sample size. AICDR.DATA provides the access point for processor/DMA to write to transmit FIFO and read from receive FIFO. One time access to AICDR.DATA process one sample. The sample data should be put in LSB (Least Significant Bit) in memory or processor registers. For transmitting, bits exceed sample are discarded. For receiving, these bits are set to 0. Figure 17-12 illustrates the FIFOs access.

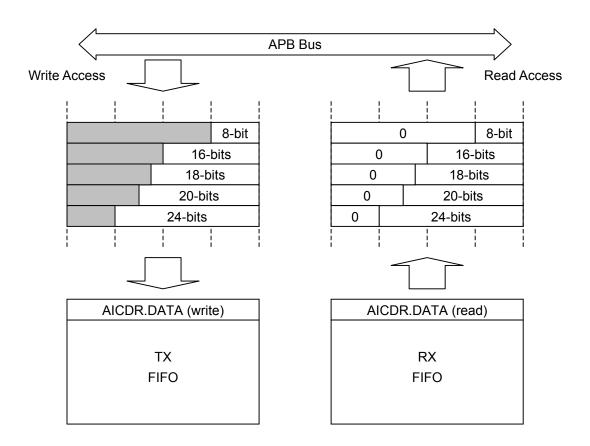

Figure 17-12 Transmitting/Receiving FIFO access via APB Bus

The software and bus initiator must guarantee the right sample placement at the bus.

In case of DMA bus initiator, one 24, 20, 18 bits audio sample must occupies one 32-bits word in memory, so 32-bits width DMA must be used. One 16 bits sample occupies one 16-bits half word in memory, so 16-bits width DMA must be used. One 8-bits sample occupies one byte in memory, and use 8-bits width DMA.

In case of processor bus initiator, any type of the audio sample must occupies one CPU

general-purpose register at LSB, and read/write from/to AICDR.DATA with 32-bits load/store instruction. When process small sample size, 16-bits or 8-bits, software may need to do the data pack/unpack.

The AICFR.TFTH and AICFR.RFTH are used to set the FIFO level thresholds, which are the trig levels of DMA request and/or FIFO service interrupt. The AICFR.TFTH and AICFR.RFTH should be set to proper values, too small or too big are not good. When it is too small, the DMA burst length or the number of sample can be processed by processor is too small, which harms the bus or processor efficiency. When it is too big, the bus or the interrupt latency left for under-run/over-run is too small, which may causes replay/record errors.

AICSR.TUR is set to 1 during transmit under-run conditions. If AICCR.ETUR is 1, this can trigger an interrupt. During transmit under-run conditions, zero or last sample is continuously sent out across the serial link. Transmit under-run can occur under the following conditions:

- 1. Valid transmit data is still available in memory, but the DMA controller/processor starves the transmit FIFO, as it is busy servicing other higher-priority tasks.
- 2. The DMA controller/processor has transferred all valid data from memory to the transmit FIFO.

AICSR.ROR is set to 1 during receive over-run conditions. If AICCR.EROR is 1, this can trigger an interrupt. During receive over-run conditions, data sent by the CODEC is lost and is not recorded.

When replay/record two channels data, the left channel is always the first data in FIFOs and in the serial link. If multiple channels in AC-link are used, the channel sample order is follows the slot order.

17.4.8 Data Flow Control

There are three approaches provided to control/synchronize the audio incoming/outgoing data flow.

17.4.8.1 Polling and Processor Access

AICSR.RFL and AICSR.TFL reflect how many samples exist in receiving and transmitting FIFOs. Through read these register fields, processor can detect when there are samples in receiving FIFO in audio record and then load them from the RX-FIFO, and when there are rooms in transmitting FIFO in audio replay and then store samples to the TX-FIFO.

Polling approach is in very low efficiency and is not recommended.

17.4.8.2 Interrupt and Processor Access

Set proper values to AICFR.TFTH and AICFR.RFTH, the FIFO interrupts trig thresholds. Set AICCR.ETFS and/or AICCR.ERFS to 1 to enable transmitting and/or receiving FIFO level trigger interrupts. When the interrupt found, it means there are rooms or samples in the TX or RX FIFO, and processor can store or load samples to or from the FIFO.

Interrupt approach is more efficient than polling approach.

17.4.8.3 DMA Access

Audio data is real time stream, though it is in low data bandwidth, usually less than 1.2Mbps. DMA approach is the most efficient and is the recommended approach.

To enable DMA operation, set AICCR.TDMS and AICCR.RDMS to 1 for transmit and receive respectively. It also needs to allocate two channels in DMA controller for data transmitting and receiving respectively. Please reference to the processor's DMA controller spec for the details.

The AICFR.TFTH and AICFR.RFTH are used to set the transmitting and receiving FIFO level thresholds, which determine the issuing of DMA request to DMA controller. To respond the request, DMAC initiator and controls the data movement between memory and TX/RX FIFO.

17.4.9 Serial Audio Clocks and Sampling Frequencies

For internal CODEC, CODEC module containing the audio CODEC circuit/logic and corresponding controlling registers. CODEC needs a 12MHz clock from CPM called SYS_CLK and provides I_BITCLK, O_BITCLK and I_SYNC, O_SYNC (left-right clock which is the sample rate as ADC or DAC) to AIC for outgoing and incoming audio respectively. These clocks change when change the sample rate in CODEC controlling registers. When using internal CODEC, must configure SYNC and BIT CLK as input, more details refers to CODEC Spec.

For AC-link, the bit clock is input from chip external and is fixed to 12.288MHz. The sample frequency of 48kHz is supported in nature. Variable Sample Rate feature is supported in this AIC. If the CODEC supports this feature, sample rate other than 48kHz audio data can be replay directly. Otherwise, software has to do the rate transfer to replay other sample rate audio data. Double rate, 96kHz or even 88.2kHz audio is also supported with proper CODEC.

Following are for BIT_CLK/SYS_CLK configuration in I2S/MSB-Justified format with external CODEC.

The BIT_CLK is the rate at which audio data bits enter or leave the AIC. BIT_CLK can be supplied either by the CODEC or an internally PLL. If it is supplied internally, BIT_CLK is configured as output pins, and is supplied out to the CODEC. If BIT_CLK is supplied by the CODEC, then it is configured as an input pin. Register bit AICFR.BCKD is used to select BIT_CLK direction.

The audio sampling frequency is the frequency of the SYNC signal, which must be 1/64 of BIT_CLK, $f_{BIT\ CLK} = 64\ f_{S.}$ But SYNC signal frequency is not fixed when using internal CODEC.

SYS_CLK is only for CODEC. It usually takes one of the two roles, as CODEC master clock input or as CODEC over-sampling clock input. If SYS_CLK roles as CODEC master clock input, it usually should be set to a fixed frequency according to CODEC requirement but independent to audio sample rate. In this case, usually there is a PLL in the CODEC and CODEC roles master mode. See Figure 17-3 for the interface diagram. This is the recommended AIC CODEC system configuration.

If SYS_CLK roles as CODEC over-sampling clock, its frequency is usually 4, 6, 8 or 12 times of BIT_CLK frequency, which are 256, 384, 512 and 768 times of audio sample rates. Table 17-6 lists the relation between sample rate, BIT_CLK and SYS_CLK frequencies.

Table 17-6 Audio Sampling rate, BIT_CLK and SYS_CLK frequencies

Sample Rate	BIT_CLK (MHz)	SYS_CLK (MHz)				
f _S (kHz)	f _{BIT_CLK} = 64 f _S	256 f _S	384 f _s	512 f _s	768 f _s	
48	3.072	12.288	18.432	24.576	36.864	
44.1	2.8224	11.2896	16.9344	22.5792	33.8688	

32	2.048	8.192	12.288	16.384	24.576
24	1.536	6.144	9.216	12.288	18.432
22.05	1.4112	5.6448	8.4672	11.2896	16.9344
16	1.024	4.096	6.144	8.192	12.288
11.025	0.7056	2.8224	4.2336	5.6448	8.4672
8	0.512	2.048	3.072	4.096	6.144

In this processor, SYS_CLK can be selected from EXCLK or generated by dividing the PLL output clock in a CPM divider controlled by I2SCDR. If BIT_CLK is chosen as an output, another divider in AIC is used to divide SYS_CLK for it.

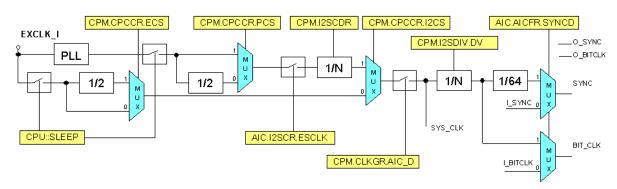

Figure 17-13 SYS_CLK, BIT_CLK and SYNC generation scheme

The setting of I2SDIV.DV is shown in Table 17-7.

I2SDIV.DV	f _{SYS_CLK}	f _{BIT_CLK}	f _{SYS_CLK} / f _{BIT_CLK}
0x1	128 f _S	64 f _S	2
0x2	196 f _S	64 f _S	3
0x3	256 f _S	64 f _S	4
0x5	384 f _S	64 f _S	6
0x7	512 f _S	64 f _S	8
0xB	768 f _S	64 f _S	12

Table 17-7 BIT_CLK divider setting

As we observe in Table 17-6, if SYS_CLK is taken as over-sampling clock by CODEC, the common multiple of all SYS_CLK frequencies is much bigger than the PLL output clock frequency. To generate all different SYS_CLK frequencies, one approach is change PLL frequency according to sample rate. This is not realistic, since frequently change PLL frequency during normal operation is not recommended.

Another approach is to found some approximate common multiples of all SYS_CLK frequencies according to the fact that there tolerance in audio sample rate. Take $f_{SYS_CLK} = 256 f_S$, Table 17-8 list

most frequencies, which are less than 400MHz, with relatively small sample rate errors. It is suggested to set PLL frequency as close to the frequencies listed as possible, then use clock dividers to generate different SYS_CLK/BIT_CLK for different sample rate.

Table 17-8 Approximate common multiple of SYS_CLK for all sample rates

Approximate Common	Max Error Caused in
Frequency (MHz)	Audio Sample Rate (%)
123.53	0.53
147.11	0.24
170.68	0.79
235.5	0.87
247.06	0.53
270.64	0.11
280.56	0.73
294.22	0.24
305.14	0.67
317.79	0.53
329.57	0.66
341.35	0.79
347	0.85
353.13	0.90
358.79	0.69
370.59	0.53
382.96	0.54
394.17	0.24

Take PLL = 270.64 MHz as an example, Table 17-9 lists the divider settings for various sample rates.

Table 17-9 CPM/AIC clock divider setting for various sampling rate if PLL = 270.64MHz

Sample Rate (kHz)	I2SCDR	I2SDIV.DV	Sample Rate Error (%)
48	1	11	0.11
44.1	1	12	-0.11
32	0	33	0.11
24	1	22	0.11
22.05	1	24	-0.11
16	1	33	0.11
12	1	44	0.11
11.025	1	48	-0.11
8	1	66	0.11

For an EXCLK clock frequency, try to generate PLL frequencies as close to the frequencies listed in Table 17-8 as possible. Table 17-10 lists the PLL parameters and audio sample errors at different PLL frequencies for EXCLK at 12MHz.

Table 17-10 PLL parameters and audio sample errors for EXCLK=12MHz

	Max Sample		
M	N	Freq (MHz)	Rate Error
103	10	123.6	0.59%
49	4	147	0.31%
128	9	170.67	0.79%
157	8	235.5	0.87%
103	5	247.2	0.59%
65	3	260	0.82%
45	2	270	0.35%
203	9	270.67	0.12%
113	5	271.2	0.32%
187	8	280.5	0.75%
237	10	284.4	0.81%
49	2	294	0.31%
178	7	305.14	0.67%
53	2	318	0.60%
302	11	329.45	0.70%
256	9	341.33	0.79%
318	11	346.91	0.88%
206	7	353.14	0.90%
299	10	358.8	0.69%
247	8	370.5	0.55%
351	11	382.91	0.55%
230	7	394.29	0.27%

The BIT_CLK should be stopped temporary when change the divider settings, or when change BIT_CLK source (from internal or external), to prevent clock glitch. Register I2SCR.STPBK is provided to assist the task. When I2SCR.STPBK = 1, BIT_CLK is disabled no matter whether it is generated internally or inputted from the external source. The operation flow is described in following.

- Stop all replay/record by clear AICCR.ERPL and AICCR.EREC.
- Polling I2SSR.BSY till it is 0
- Stop the BIT CLK by write 1 to I2SCR.STPBK
- Operations concerning BIT CLK
- Resume the BIT_CLK by write 0 to I2SCR.STPBK

17.4.10 Interrupts

The following status bits, if enabled, interrupt the processor:

- Receive FIFO Service (AICSR.RFS). It's also DMA Request
- Transmit FIFO Service (AICSR.TFS). It's also DMA Request
- Transmit Under-Run (AICSR.TUR)
- Receive Over-Run (AICSR.ROR)
- Command Address and Data Transmitted, AC-link only (ACSR.CADT)
- External CODEC Registers Status Address and Data Received, AC-link only (ACSR.SADR)
- External CODEC Registers Read Status Time Out, AC-link only (ACSR.RSTO)

For further details, see the corresponding register description sections.

18 Internal CODEC Interface

18.1 Overview

This chapter describes the embedded audio CODEC in processor and related software interface.

This embedded CODEC is an I2S audio CODEC. AIC module is an interface to this CODEC in audio data replaying and recording. Several memory mapped registers are used to access this embedded CODEC, and write/read these registers could access the CODEC's internal control and configure registers that is using 12Mhz clock.

18.1.1 Features

The following are internal CODEC features:

- 1. 24 bits ADC and DAC,
- 2. Headphone load up to 16 Ohm
- 3. Sample frequency supported: 8k, 9.6k, 12k, 11.025k, 12k, 16k, 22.05k, 24k, 32k, 44.1k, 48k, 96k.
- 4. Two MIC input, 85db SNR
- 5. Stereo line input,
- 6. Separate power-down modes for ADC and DAC path with several shutdown modes;
- 7. Reduction of audible glitches systems: Pop Reduction system, Soft Mute mode;
- 8. Support capacitor-less headphone connection.
 - **OPT** = pins or functions may not available in some specify chip.
 - TBD = parameter or document section to be defined later on
 - TBC = parameter or document section subject to change
 - TO BE COMPLETED = section to be filled or subject to change

18.1.2 Signal Descriptions

CODEC has max 13 analog signal IO pins and 4 power pins on chip. They are listed and described in Table 18-1.

Table 18-1 CODEC signal IO pin description

Pin Names	Ю	Note	Pin Description	Power
AOHPL	АО		Left headphone out	AVDHP
AOHPR	АО		Right headphone out	AVDHP
AOHPM	АО	OPT	Headphone common mode output	AVDHP
AOHPMS	Al	OPT	Headphone common mode sense input (connect to AOHPM)	AVDHP
MICP1	ΑI		Microphone mono differential analog input 1 (MIC1), positive pin	AVDCDC
MICN1	Al	ОРТ	Microphone mono differential analog input 1 (MIC1), negative pin	AVDCDC
MICP2	Al	OPT	Microphone mono differential analog input 2 (MIC2), positive pin	AVDCDC
MICN2	Al	OPT	Microphone mono differential analog input 2 (MIC2), negative pin	AVDCDC
MICBIAS	АО	OPT	Microphone bias	AVDCDC
AIL	ΑI		Left line input. Also named LLINEIN in some place	AVDCDC
AIR	ΑI		Right line input. Also named RLINEIN in some place	AVDCDC
VCOM	АО		Voltage Reference Output. An electrolytic capacitor more than 10µF in parallel with a 0.1µF ceramic capacitor attached from this pin to AVSCDC eliminates the effects of high frequency noise.	AVDCDC
AVDHP	Р		Headphone amplifier power, 3.3V	-
AVSHP	Р		Headphone amplifier ground	-
AVDCDC	Р		CODEC analog power, 3.3V, inter signal VREFP	-
AVSCDC	Р		CODEC analog ground, inter signal VREFN	-
HPSENSE	Al	OPT	Headphone jack sense.	AVDHP

Note:

- (1) AVDHP = 3.3v (typ).
- (2) AVDCDC= 3.3v (typ)
- (3) Inter signal VREFP is connected to AVDCDC, inter signal VREFN is connected to AVSCDC.
- (4) Please refer to data sheet of the chip for details
- (5) In target chip package, NOT all pins are available. Please refer to the chip specification

18.1.3 Block Diagram

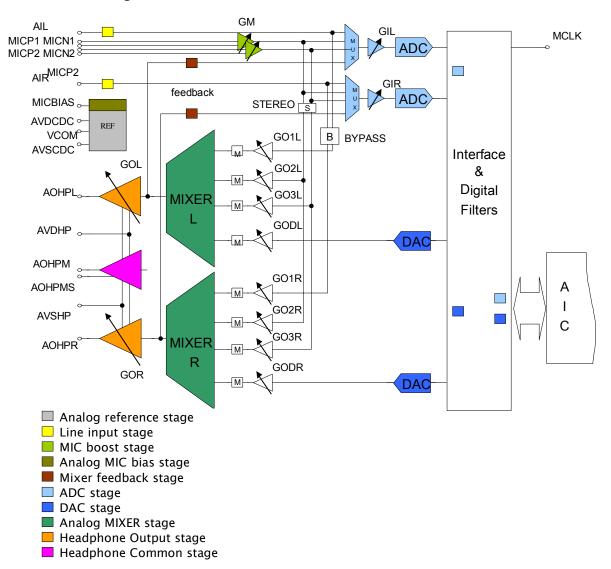

Figure 18-1 CODEC block diagram

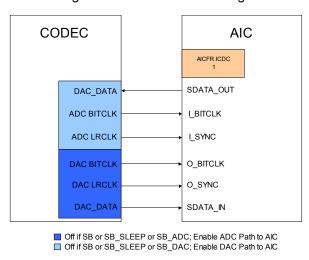

Figure 18-2 Internal CODEC works with AIC

18.2 Mapped Register Descriptions

The internal CODEC software interface includes 2 registers. They are mapped in IO memory address space of AIC module so that program can access them to control the operations of the CODEC.

Table 18-2 Internal CODEC Mapped Registers Description (AIC Registers)

Name	Description	RW	Reset value	Address	Size
RGADW	Address, data in and write command for accessing to internal registers of internal embedded CODEC	RW	0x00000000	0x100200A4	32
RGDATA	The read out data and interrupt request status of Internal registers data in the internal embedded CODEC.	R	0x00000000	0x100200A8	32

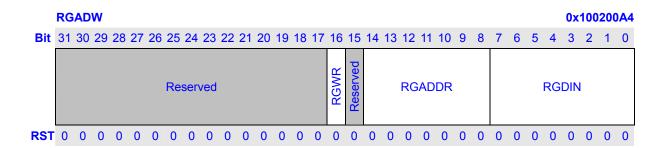

Note:

- 3. All these registers are AIC Registers, because they are mapped in AIC IO memory address.
- 4. RGADW contains data, address and write command to the internal registers of the internal CODEC.
- 5. RGDATA returns the internal register value of the internal CODEC and interrupt request status.

18.2.1 CODEC internal register access control (RGADW)

RGADW contains address, data and write command to the internal registers of the internal embedded CODEC.

Bits	Name	Description	RW
31:17	Reserved	Writes to these bits have no effect and always read as 0	R
16	RGWR	Write 1 to this bit issues writing to CODEC's internal register process.	RW
		This bit keeps value 1 until the current writing process is finished. A	
		register read or a new register writing process cannot be issued before	
		the previous writing process finished. In another word, it should not	
		write to RGADW before RGADW.RGWR becomes 0. A writing process	
		takes max of 0.17us plus 1 PCLK cycle. Write 0 to this bit is ignored.	
15	Reserved	Writes to these bits have no effect and always read as 0	R
14:8	RGADDR	When it issues a writing to CODEC's internal register command, i.e.	RW
		RGWR=1, this field specifies the register's address. In addition, this	
		field also decides the address of the register's data out at any time.	
7:0	RGDIN	When it issues a writing to CODEC's internal register command, i.e.	RW
		RGWR=1, this field contains the data to be written to the register.	

Note:

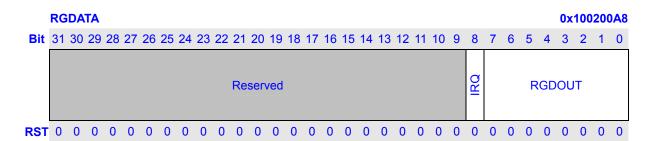

It is strong suggesting verifying the data (using read RGDATA below) after writing it to internal register of CODEC. When RGDATA returns the right data which writing to the address, the writing process is finish.

Please notice that AIC needs SYS_CLK (refers to <u>AIC spec</u>), when write new value to or read from CODEC internal registers.

18.2.2 CODEC internal register data output (RGDATA)

RGDATA returns the internal register value of the internal embedded CODEC and interrupt request status.

Bits	Name	Description			RW
31:9	Reserved	Wr	Writes to these bits have no effect and always read as 0		
8	IRQ	Th	This field returns the internal embedded CODEC's interrupt request.		
			IRQ	Description	
			0	No CODEC's interrupt request found	
			1	CODEC's interrupt request is pending	
7:0	RGDOUT	Th	This field returns the value of the internal register in internal embedded F		
		CC	CODEC. As the RGADW.RGADDR field specifies the register's		
		ade	dress.		

Please notice that AIC needs SYS_CLK (refers to <u>AIC spec</u>), when write new value to or read from CODEC internal registers.

18.3 Operation

The internal embedded CODEC is controlled its internal registers. These registers can be accessed by through memory-mapped registers, RGADW and RGDATA, just like L3 bus or I2C bus for an external CODEC. AIC's BITCLK and SYNC are from/to the CODEC and is controlled by CKCFG.SELAD register. The audio data transferring, i.e. audio replaying and recording, is down by AIC. AIC still takes the role of I2S controller. We will refer to many AIC operations and registers in the following audio operation descriptions, please reference to AIC Spec for the details. This is a guide for software.

18.3.1 Access to internal registers of the embedded CODEC

The embedded CODEC is controlled through its internal registers. RGADW and RGDATA are used to write to and read from these registers. Here are some examples.

```
Example 1. Write to a CODEC internal register
```

Step 1: RGADW.RGWR == 0?

Step 2: If not, go to step 1

Step 3: Write to RGADW and make it:

RGADW.RGDIN = <data to be written to the register>;

RGADW.RGADDR = <the register's address >;

Step 4: Write to RGADW to commit the writing operation:

RGADW.RGWR = 1;

Example 2. Read from a CODEC internal register

Step 1: RGADW.RGWR == 0?

Step 2: If not, go to step 1

Step 3: write to RGADW and make it:

RGADW.RGWR = 0;

RGADW.RGDIN = <don't care>;

RGADW.RGADDR = <the register's address>;

Step 4: read RGDATA.DOUT, which returns the register's content

18.3.2 CODEC controlling and typical operations

This section is some typical operations. We are assumed the power supply of CODEC is on, and CODEC is in STANDBY mode, CRR is configured for audio Ramping system, clear PMR2.SB_MC to 0 in capacitor-less connection mode (refers to capacitor-less headphone connection).

Before using any of these operations, make sure AIC is configured properly as list below:

1. Make AIC to use internal CODEC mode:

AICFR.ICDC = 1; Use internal CODEC.

AICFR.AUSEL = 1; Use I2S mode.

AICFR.BCKD = 0; CODEC input BIT_CLK to AIC.

AICFR.SYNCD = 0; CODEC input SYNC to AIC.

I2SCR.AMSL = 1; Use I2S operation mode.

I2SCR.ESCLK = 1; Open SYS CLK to internal CODEC.(if using PLL Clock)

- 2. Make sure AICCR.FLUSH = 0; AICFR.RST = 0; AICCR.ENLBF = 0;
- 3. Clear AICSR.ROR, AICSR.TUR, AICSR.RFS, AICSR.TFS = 0 to 0.
- 4. Set proper value to AICCR.M2S; AICCR.ENDSW; AICCR.ASVTSU
- 5. Set AICFR.ENB to 1; Open AIC.

When using DMA mode, configure AICFR.RFTH, AICCR.RDMS or AICFR.TFTH, AICCR.TDMS.

Configure TX-FIFO and interrupt means setting proper value to AICFR.TFTH, clear AICCR.ETFS to 0, and clear AICCR.ETUR to 0.

Configure RX-FIFO and interrupt means setting proper value to AICFR.RFTH, clear AICCR.ERFS to 0 and clear AICCR.EROR to 0.

When configure interrupt, software must handle all the interrupt. So all interrupt is recommended disabled as shown above.

CODEC shares the interrupt with AIC module.

The register or register bit of CODEC will use the same form as the Mapped registers, but software should use the method in the section <u>1.3.2</u> to access this registers.

All the REF parts of the working part diagrams are working. More details are listed in the CODEC guide.

18.3.3 Power saving

There are many power modes in CODEC. In every working mode, it should close stages (parts) of CODEC for saving power.

The power diagram is shown in Figure 2-7 CODEC Power Diagram; please refer to <u>2.8 CODEC</u> <u>Operating modes</u>.

18.3.4 Pop noise and the reduction of it

Please refre to <u>2.8.9 Anti-pop operation sequences</u>.

18.3.4.1 Reference open step

1. Init play

Step 0: Open DMA and two AIC modules Clocks in CPM.CLKGR

- Step 1: Configure AIC as slave and using inter CODEC mode.
- Step 2: Configure DMA as slave mode using internal CODEC
 - o Open
- Step 0: Enable DMA Channel Clock
- Step 1: Configure AIC sample size and sample rate. Configure AIC Output FIFO Threshold,
- Step 2: Configure DMA
- Step 3: Configure CODEC
 - o Write
- Step 0: Enable DMA Channel Clock
- Step 1: Configure AIC
- Step 2: Configure DMA
- Step 3: Configure CODEC
 - o Read
- Step 0: Enable DMA Channel Clock
- Step 1: Configure AIC
- Step 2: Configure DMA
- Step 3: Configure CODEC
 - o Close
 - o End
- 1. Open DMA and two AIC modules Clocks in CPM.CLKGR:
 - CPM.CLKGR &= ~1060;
- 2. Close (DMA and) two AIC modules Clocks in CPM.CLKGR:
 - CPM.CLKGR |= 1060;
- 3. Configure AIC as slave and using inter CODEC mode.
 - AICFR.ICDC = 1; Use internal CODEC.
 - AICFR.AUSEL = 1; Use I2S mode.
 - AICFR.BCKD = 0; CODEC input BIT_CLK to AIC.

 AICFR.SYNCD = 0; CODEC input SYNC to AIC.

 I2SCR.AMSL = 1; Use I2S operation mode.
 - I2SCR.ESCLK = 1; Open SYS_CLK to internal CODEC.
- 4. Enable DMA channel clock that is used for transferring data from/to AIC module.

18.4 Timing parameters

- 1. Tsbyu: Reference wake-up time after complete power down.
 - When Cext = 10uF/100nF +/-20%, Typical value of Tsbyu is 250ms, Max is 500ms.
- 2. Tshd adc: ADC wake-up time after SLEEP mode
 - When Cext = 10uF/100nF + -20%, Typical value is 200ms(TBC)
- 1. Tshd dac: DAC wake-up time after SLEEP mode
 - When Cext = 10uF/100nF + -20% Typical value is to be defined later on.
 - The Cext is the two decoupling capacitors between the VREF and VREFN (AVSCDC). Refer to
- 2.9.1 Avoid quiet ground common currents.

18.5 AC & DC parameters

Votages:

AVSHP and AVSCDC are connected to analog ground.

AVDHP = 3.3v (typ).

AVDCDCP= 3.3v (typ)

Currents:

Mode	Currents
1 Complete down (Static)	I _{AVDCDC} + I _{AVDHP} < 5 μ A
2 SLEEP mode (Static)	TBD
3 SLEEP mode with MCLK(Static)	TBD
4 Playback to AOHPR/AOHPL(Silence)	2 mA < I _{AVDCDC} + I _{AVDHP} < 8 mA
5 Record from AIL/AIR(Silence)	1.5 mA < I _{AVDCDC} + I _{AVDHP} < 6 mA
6 Playback with Record (4 + 5 Silence)	3 mA < I _{AVDCDC} + I _{AVDHP} < 10 mA
7 Playback to AOHPR/AOHPL(Digital Full Scale)	TBD
8 Record from AIL/AIR(2.8Vpp)	TBD
9 Playback with Record (7 + 8 Full Scale)	TBD

Current value is at AVDCDC = AVDHP = 3.3 V.

Chip pin Name	ne MAX Current across I/O @ AVDCDC = AVDHP = 3.3 V		
AVDCDCP	< 20 mA in normal working mode		
AVSCDCP	< 20 mA in normal working mode		
AVDHP	< 160 mA in normal working mode		
AVDITE	< 1400 mA in case of short circuit		
AVSHP	< 160 mA in normal working mode		
AVSHE	< 1400 mA in case of short circuit		
VCOM	< 2 mA in normal working mode		
MICP < 2 mA in normal working mode			
MICBIAS < 5 mA in normal working mode			
AIL, AIR < 2 mA in normal working mode			
AOHPL	< 80 mA in normal working mode		
AONFL	< 1200 mA in case of short circuit		
AOHPR	< 80 mA in normal working mode		
AURK	< 1200 mA in case of short circuit		
AOHPM	< 160 mA in normal working mode		
AOHFW	< 1400 mA in case of short circuit		
AOHPMS	OHPMS < 1 mA in normal working mode		

Please refer to Chip Datasheet for more details.

18.6 CODEC Configuration guide

18.6.1 CODEC internal Registers

Register	Function	Address	Reset	Software	
Name			value	Write	
AICR Audio Interface Control		00000 / 00 / 00	0C	0F

CR3	Control Register 3	10110 / 22 / 16	C0	C0 ^[2]	
AGC1	Automatic Gain Control 1	10111 / 23 / 17	34		
AGC2	Automatic Gain Control 2	11000 / 24 / 18	07		
AGC3	Automatic Gain Control 3	11001 / 25 / 19	44		
AGC4	Automatic Gain Control 4	11010 / 26 / 1A	1F		
AGC5	Automatic Gain Control 5	11011 / 27 / 1B	00		

NOTE:

- [1]. After write AFR by reading AFR value for clear AFR, Must set ICR to A0.
- [2]. This register should keep the reset value 11000000(C0) in REPLAY mode
- [3]. Before configuration the CODEC make sure the CONFIG* field configured properly first.

18.6.2 CODEC internal registers

18.6.2.1 AICR: Audio Interface Control Register

Register Name: AICR Register Address: 0x00

bit7-RW-0 bit6-RW-0 bit5-RW-0 bit4-RW-0 bit3-RW-1 bit2-RW-1 bit1-RW-0 bit0-RW-0

Reserved CONFIG1

Bits	Field	Description			
7:4	Reserved	These bits are not used, when read is 0000.			
3:0	CONFIG1	These bits must be set to 1111			

Note:

- This register should keep the value 00001111 by software for proper configuration status.
- Must set a value to every CONFIGn(n=1 to 8) field before use this CODEC, here is CONFIG1.

18.6.2.2 CR1: Control Register 1

Register Name: CR1 Register Address: 0x01

bit7-RW-1 bit6-RW-0 Bit5-RW-1 bit4-RW-0 bit3-RW-1 bit2-RW-0 bit1-RW-1 bit0-RW-0

SB_MICBIAS MONO DAC_MUTE HP_DIS DACSEL BYPASS Reserved

Bits	Field	Description
7	SB_MICBIAS	Microphone biasing buffer power-down
		0 = active
		1 = power-down
6	MONO	Stereo-to-mono conversion for DAC path
		0 = stereo
		1 = mono
5	DAC_MUTE	DAC soft mute mode
		0 = mute inactive, digital input signal transmitted to the DAC
		1 = puts the DAC in soft mute mode
4	HP_DIS	HeadPhone output signal disabled
		0 = Signal applied to headphone outputs
		1 = no signal on headphone outputs, acts as a mute signal
3	DACSEL	Mixer input selection
		0 = DAC output ignored in input of the mixer
		1 = DAC output selected as an input of the mixer
2	BYPASS	Mixer input selection (line)
		0 = Bypass path ignored in input of the mixer
		1 = Bypass path selected as an input of the mixer
1:0	Reserved	These bits are not used, when read is 00.

18.6.2.3 CR2: Control Register 2

Register Name: CR2 Register Address: 0x02

bit7-RW-0	bit6-RW-1	Bit5-RW-1	Bit4-RW-1	bit3-RW-1	bit2-RW-0	bit1-RW-0	bit0-RW-0
DAC_DEEMP	DAC_ADWL		ADC_	ADWL	ADC_HPF	Rese	erved

Bits	Field	Description			
7	DAC_DEEMP	DAC De-emphasize filter enable			
		0 = inactive			
		1 = enables the de-emphasis filter			
6:5	DAC_ADWL	Audio Data Word Length of DAC path			
		00 = 16-bit word length data			
		01 = 18-bit word length data			
		10 = 20-bit word length data			
		11 = 24-bit word length data			
4:3	ADC_ADWL	Audio Data Word Length of ADC path			
		00 = 16-bit word length data			
		01 = 18-bit word length data			
		10 = 20-bit word length data			
		11 = 24-bit word length data			
2	ADC_HPF	ADC High Pass Filter enable			
		0 = inactive			
		1 = enables the ADC High Pass Filter			
1:0	Reserved	These bits are not used, when read is 00.			

18.6.2.4 CR3: Control Register 3

Register Name: CR3 Register Address: 0x16

bit7-RW-1	bit6-RW-1	bit5-RW-0	Bit4-RW-0	bit3-RW-0	bit2-RW-0	bit1-RW-0	bit0-RW-0
SB MIC1	SB MIC2	SIDETONE1	SIDETONE2	MICDIFF	MICSTERFO	INS	FI

Bits	Field	Description				
7	SB_MIC1	Analog Microphone 1 (MIC1) Input conditioning circuitry power-down				
		mode.				
		0 = active				
		1 = power-down				
6	SB_MIC2	Analog Microphone 2 (MIC2) Input conditioning circuitry power-down				
		mode.				
		0 = active				
		1 = power-down				
5	SIDETONE1	Select Microphone 1 (MIC1) as an input of Mixer;				
		0 = Sidetone1 path ignored in input of the mixer				

		1 = Sidetone1 path selected as an input of the mixer							
		NOTE: It must configure in RECORD with Direct Playback mode. This							
		signal is also affected by MICSTEREO. Refer to its description.							
4	SIDETONE2	Select Micro	ophone 2 (N	/IIC2) as an	input of Mixer;				
		0 = Side	tone1 path	ignored in i	nput of the mixer				
		1 = Side	tone1 path	selected as	an input of the m	ixer			
		NOTE: It mu	ust configur	e in RECOI	RD with Direct Pla	yback mode. This			
		signal is als	o affected b	y MICSTEI	REO. Refer to its	description.			
3	MICDIFF	Microphone	input mode	e selection.					
		0= Micropho	one sinale-e	ended input	S				
		1= Micropho							
2	MICSTEREO	Microphone input mode selection							
			•						
		0= Micropho		•

		0	4	0	MIC2	MIC2			
		0 1 1 MIC1				MIC2			
		1	1	X	MIC1 & MIC2	MIC1 & MIC2			
1:0	INSEL	Selection of	the input s	ignal conve	rted by the ADC;				
		00 = Microphone 1 (MIC1) input to left and right channels							
		01 = Microphone 2 (MIC2) input to left and right channels							
		10 = Line input							
		11 = Mixer (•						
	1								

NOTE:

- This register should keep the reset value 11000000 in REPLAY mode.
- Please refer to section <u>2.8 CODEC Operating modes</u>.

18.6.2.5 CCR1: Control Clock Register 1

Register Name: CCR1 Register Address: 0x03

bit7-RW-0 bit6-RW-0 Bit5-RW-0 bit4-RW-0 bit3-RW-0 bit2-RW-0 bit1-RW-0 bit0-RW-0

Reserved	CONFIG4

Bits	Field	Description
7:4	Reserved	This bits are not used
3:0	CONFIG4	These bits must be clear to 0000.

NOTE:

- 1. This register should keep the reset value 00000000
- 2. The CONFIG4 value 0000 means CODEC use the inter 12Mhz clock.

18.6.2.6 CCR2: Control Clock Register 2

Register Name: CCR2 Register Address: 0x04

bit7-RW-0 bit6-RW-0 Bit5-RW-0 bit4-RW-0 bit3-RW-0 bit2-RW-0 bit1-RW-0 bit0-RW-0

DFREQ AFREQ

Bits	Field	Description
7:4	DFREQ	Selection of the DAC sampling rate (Fs)
		NOTE: The sampling frequency value is given in the FREQ[3:0] table
3:0	AFREQ	Selection of the ADC sampling rate (Fs)
		NOTE: The sampling frequency value is given in the FREQ[3:0] table

Note: Please refer to section 2.4 Sample frequency: FREQ.

18.6.2.7 PMR1: Power Mode Register 1

Register Name: PMR1 Register Address: 0x05

bit7-RW-1	bit6-RW-1	Bit5-RW-1	bit4-RW-1	bit3-RW-1	bit2-RW-1	bit1-RW-1	bit0-RW-1
SB_DAC	SB_OUT	SB_MIX	SB_ADC	SB_LIN	Reserved		SB_IND

Bits	Field	Description
7	SB_DAC	DAC power-down mode
		0 = active
		1 = power-down
6	SB_OUT	Output Stage power-down mode
		0 = active
		1 = power-down
5	SB_MIX	Mixer and line output stage power-down
		0 = active
		1 = power-down
4	SB_ADC	ADC power-down mode
		0 = active
		1 = power-down
3	SB_LIN	Analog line Input (Bypass) conditioning circuitry power-down mode
		0 = active
		1 = power-down
2:1	Reserved	These bits are not used, when read is 11.
0	SB_IND	Mixer to ADC circuitry power-down mode
		0 = active

		1 = power-down
--	--	----------------

Note: Please refer to section <u>2.8 CODEC Operating modes</u>.

18.6.2.8 PMR2: Power Mode Register 2

Register Name: PMR2 Register Address: 0x06

bit7-RW-0	bit6-RW-0	bit5-RW-0	bit4-RW-0	bit3-RW-0	bit2-RW-0	bit1-RW-1	bit0-RW-1
LRGI	RLGI	LRGOD	RLGOD	GIM	SB_MC	SB	SB_SLEEP

Bits	Field	Description
7:6	LRGI, RLGI	PGATM input gain coupling.
		00 = Left and right channels gains are independent, respectively
		given by GIL and GIR
		10 = Left and right channels gain is given by GIR
		01 = Left and right channels gain is given by GIL
		11 = Left and right channels gain is given by GIR
5:4	LRGOD, RLGOD	DAC mixing gain coupling
		00 = Left and right channels gains are independent, respectively
		given by GODL and GODR
		10 = Left and right channels gain is given by GODR
		01 = Left and right channels gain is given by GODL
		11 = Left and right channels gain is given by GODR
3	GIM	Microphone (MIC1) amplifier gain control
		0 = 0 dB gain
		1 = 20 dB gain
2	SB_MC	Output Stage common mode buffer power-down
		0 = active (capacitor less headphone output configuration)
		1 = power-down (line output configuration)
1	SB	Complete power-down mode
		0 = normal mode (active)
		1 = complete power-down
0	SB_SLEEP	SLEEP mode
		0 = normal mode (active)
		1 = SLEEP mode

Note:

- 3. Please refer to section 2.8 CODEC Operating modes, 2.3.1 Programmable boost gain: GIM
- 4. Please refer to section <u>2.9.3 Capacitor-coupled headphone connection</u>, <u>2.9.2 Capacitor-less headphone connection</u> for SB_MC setting.

18.6.2.9 CRR: Control Ramp Register

Register Name: CRR Register Address: 0x07

	bit7-RW-0	bit6-RW-1	bit5-RW-0	bit4-RW-1	bit3-RW-0	bit2-RW-0	bit1-RW-0	bit0-RW-1
ĺ	Reserved	RATIO			KFAST		TRE	ESH

Bits	Field	Description
7	Reserved	This bit are not used, when read is 0.
6:5	RATIO	Ratio between fast and slow steps
		00 = Ratio is 1
		01 = Ratio is 2
		10 = Ratio is 4 (default)
		11 = Ratio is 8
4:2	KFAST	Factor for step time in fast slope part
		000 = KFast is 1
		001 = KFast is 2
		010 = KFast is 4
		011 = KFast is 8
		100 = KFast is 16 (default)
		101 = Kfast is 32
1:0	TRESH	Threshold between fast and slow slope parts
		00 = Threshold is 0
		01 = Threshold is 32 (default)
		10 = Threshold is 64
		11 = Threshold is 128

Note:

- 1. This register should keep the reset value 01010001(51) for reduce pop-noise.
- 2. Please refer to section <u>2.6 Ramping system guide</u> for details.

18.6.2.10 ICR: Interrupt Control Register

Register Name: ICR Register Address: 0x08

Bit7-RW-0	bit6-RW-0	bit5-RW-1	bit4-RW-1	bit3-RW-1	bit2-RW-1	bit1-RW-1	bit0-RW-1
INT_FORM		JACK_MASK	CCMC_MASK	RUD_MASK	RDD_MASK	GUD_MASK	GDD_MASK

Bits	Field	Description
7:6	INT_FORM	Waveform and polarity of the IRQ signal
		00 = The generated IRQ is a high level
		01 = The generated IRQ is a low level
		10 = The generated IRQ is a high level pulse with an 8 SYS_CLK
		cycles duration.
		11 = The generated IRQ is a low level pulse with an 8 SYS_CLK
		cycles duration.
5	JACK_MASK	Mask for the JACK_EVENT flag
		0 = interrupt enabled
		1 = interrupt masked (no IRQ generation)
4	CCMC_MASK	Mask for the CCMC flag
		0 = interrupt enabled
		1 = interrupt masked (no IRQ generation)
3	RUD_MASK	Mask for the RAMP_UP_DONE flag
		0 = interrupt enabled
		1 = interrupt masked (no IRQ generation)
2	RDD_MASK	Mask for the RAMP_DOWN_DONE flag
		0 = interrupt enabled
		1 = interrupt masked (no IRQ generation)
1	GUD_MASK	Mask for the GAIN_UP_DONE flag
		0 = interrupt enabled
		1 = interrupt masked (no IRQ generation)
0	GDD_MASK	Mask for the GAIN_DOWN_DONE flag
		0 = interrupt enabled
		1 = interrupt masked (no IRQ generation)

NOTE:

- 1. When an interrupt is masked, the event do not generates any change on the IRQ signal, but the corresponding flag value is set to '1' in the IFR register.
- 2. When the IRQ signal is active on level, the IRQ signal is set to the inactive level while no IRQ occurs, which is unmasked.

- 3. When the IRQ signal is a pulse, the IRQ signal is set to the inactive state until a new non-masked event occurs in IFR[5:0] or until a masked event is unmasked.
- 4. When using CODEC Interrupt, it must set AIC.I2SCR.ESCLK to 1 and AIC.AICFR.ENB to 1.
- 5. CODEC Interrupt is sharing with AIC Interrupt.
- 6. That Writing IFR by reading current IFR value will clear all interrupt flag values.

18.6.2.11 IFR: Interrupt Flag Register

Register Name: IFR Register Address: 0x09

bit7-RW-0	Bit6-R-0	bit5-RW-0	bit4-R-0	bit3-RW-0	bit2-RW-0	bit1-RW-0	bit0-RW-0
Reserved	JACK	JACK_EVENT	CCMC	RAMP_UP	RAMP_DOW	GAIN_UP	GAIN_DOWN
				_ DONE	N_ DONE	_DONE	_DONE

Bits	Field	Description
7	Reserved	These bits are not used, when read is 000.
6	JACK	Output Jack plug detection status
		0 = no jack
		1 = output jack present.
5	JACK_EVENT	Event on output Jack plug detection status.
		0 = no event
		1 = event detected (due to JACK flag change to '0' or '1').
		Write 1 to Reset of the flag
4	CCMC	Output short circuit detection status – Reserved for future use
		Read
		0 = inactive
		1 = indicates that a short circuit has been detected by the output
		stage.
		The conditions that reset the flag are only in the capacitor-less
		headphone-ended outputs mode. AOHPL and AOHPR are driven
		through Programmable Gain Amplifiers/Attenuators.
		Write 1 to Update of the flag
3	RAMP_UP_DONE	End of output stage ramp up flag
		0 = no event
		1 = the ramp-up sequence is completed; Output Stage is active.
		Write 1 to Reset of the flag
2	RAMP_DOWN_DO	End of output stage ramp down flag
	NE	0 = no event
		1 = the ramp-down sequence is completed; Output Stage in
		stand-by mode.
		Write 1 to Reset of the flag
1	GAIN_UP_DONE	End of mute gain up sequence flag
		0 = no event
260		1

		1 = the mute sequence is completed; the DAC input signal is transmitted to the DAC path. Write 1 to Reset of the flag
0	GAIN_DOWN_DO NE	End of mute gain down sequence flag 0 = no event 1 = the mute sequence is completed; a 0 DC signal is transmitted to the DAC path. Write 1 to Reset of the flag

Note:

- 1- The flags RAMP_UP_DONE, RAMP_DOWN_DONE, GAIN_UP_DONE and GAIN_DOWN_DONE can be reset after 4 cycles of SYS_CLK.
- 2- Interpretation of any unspecified point is absolutely up to the designer of analog part, so it is need to pay a attention to using this flags in section <u>2.8.9 Operation sequences</u>.

18.6.2.12 CGR1: Control Gain Register 1

Register Name: CGR1 Register Address: 0x0A

bit7-RW-0	bit6-RW-0	Bit5-RW-0	bit4-RW-0	bit3-RW-0	bit2-RW-0	Bit1-RW-0	bit0-RW-0
	GO	DL			GC	DR	

Bits	s Field Description		
7:4	GODL	DAC mixing left channel gain programming value	
3:0	GODR	DAC mixing right channel gain programming value	

Note:

Please refer to section <u>2.3.4 Programmable attenuation GOD</u> for more details.

18.6.2.13 CGR2: Control Gain Register 2

Register Name: CGR2 Register Address: 0x0B

bit7-RW-0	bit6-RW-0	Bit5-RW-0	bit4-RW-0	bit3-RW-0	bit2-RW-1	Bit1-RW-0	bit0-RW-0
LRG01	RLG01	Reserved			GO1R		

Bits	Field	Description					
7:6	RLGO1, LRGO1	Line 1 mixing gain coupling					
		00 = Left and right channels gains are independent, respectively given by GO1L and GO1R					
		10 = Left and right channels gain is given by GO1R					
		01 = Left and right channels gain is given by GO1L					
		11 = Left and right channels gain is given by GO1R					
5	Reserved	This bit are not used, when read is 0.					

4:0	GO1R	Line 1 mixing right channel gain programming value
-----	------	--

Note:

Please refer to section 2.3.4 Programmable attenuation GOi for more details.

18.6.2.14 CGR3: Control Gain Register 3

Register Name: CGR3 Register Address: 0x0C

bit7-RW-0	bit6-RW-0	Bit5-RW-0	bit4-RW-0	bit3-RW-0	bit2-RW-1	bit1-RW-0	bit0-RW-0	
Reserved			GO1L					

Bits	Field Description				
7:5	Reserved	These bits are not used, when read is 000.			
4:0	GO1L	Line 1 mixing left channel gain programming value			

Note: Please refer to section 2.3.4 Programmable attenuation GOi for more details.

18.6.2.15 CGR4: Control Gain Register 4

Register Name: CGR4 Register Address: 0x0D

bit7-RW-0	bit6-RW-0	Bit5-RW-0	Bit4-RW-0	bit3-RW-0	bit2-RW-1	bit1-RW-0	bit0-RW-0
RLGO2	LRGO2	Reserved			GO2R		

Bits	Field	Description						
7:6	RLGO2, LRGO2	Microphone 1 mixing gain coupling						
		00 = Left and right channels gains are independent, respectively given by GO2L and GO2R						
		10 = Left and right channels gain is given by GO2L						
		01 = Left and right channels gain is given by GO2R						
		11 = Left and right channels gain is given by GO2L						
5	Reserved	This bit are not used, when read is 0.						
4:0	GO2R	Microphone 1 mixing right channel gain programming value.						

Note: Please refer to section <u>2.3.4 Programmable attenuation GOi</u> for more details.

18.6.2.16 CGR5: Control Gain Register 5

Register Name: CGR5 Register Address: 0x0E

bit7-RW-0 b	oit6-RW-0	bit5-RW-0	Bit4-RW-0	bit3-RW-0	bit2-RW-1	bit1-RW-0	bit0-RW-0
F	Reserved				GO2L		

Bits	Field	Description

bit7-RW-0 bit6-RW-0 bit5-RW-0 bit4-RW-0 bit3-RW-0 bit2-RW-1 bit1-RW-1 bit0-RW-1

NG_EN NG_THR HOLD

Bits	Field	Description			
7	NG_EN	Selection of the Noise Gate system			
		0 = inactive			
		1 = enables the noise gate system			
6:4	NG_THR	Noise Gate Threshold value			
		Input level (dB) < Noise Gate Level (dB)			
		000 = -72 dB			
		001 = -66 dB			
		by step of 6dB			
		111 = -30 dB			
3:0	HOLD	Hold time before starting AGC adjustment to the TARGET value			
		0000 = 0ms			
		0001 = 2 ms			
		0010 = 4 ms			
		Time Step x2			
		1111 = 32.768s			

Note: Please refer to section 2.7 AGC system guide for more details.

18.6.2.24 AGC3: Automatic Gain Control Register 3

Register Name: AGC3 Register Address: 0x19

bit7-RW-0 bit6-RW-1 bit5-RW-0 bit4-RW-0 bit3-RW-0 bit2-RW-1 bit1-RW-0 bit0-RW-0

ATK DCY

Bits	Field	Description
7:4	ATK	Attack Time - Gain Ramp Down
		0000 = 32 ms
		0001 = 64 ms
		by step of 32 ms
		1111 = 512 ms
3:0	DCY	Decay Time - Gain Ramp up
		0000 = 32 ms
		0001 = 64 ms
		by step of 32 ms
		1111 = 512 ms

Note:

1. DCY and ATK registers values are delays between each step of gain.

2. Please refer to section 2.7 AGC system guide for more details.

AGC4: Automatic Gain Control Register 4

Register Name: AGC4 Register Address: 0x1A

bit7-RW-0 bit6-RW-0 bit5-RW-0 bit4-RW-1 bit3-RW-1 bit2-RW-1 bit1-RW-1 bit0-RW-1

Reserved AGC_MAX

Bits	Field	Description			
7	Reserved	These bits are not used, when read is 000.			
4:0	AGC_MAX	Maximum Gain Value to apply to the ADC path			
		00000 = 0 dB			
		00001 = 1.5dB			
		by step of 1.5dB			
		01111 = 22.5dB			
		10000 = 23 dB			
		10001 = 23 dB			
		10010 = 23 dB			
		10011 = 24.5dB			
		by step of 1.5dB			
		11111 = 42.5dB			

Note:

Please refer to section <u>2.7 AGC system guide</u> for more details.

18.6.2.25 AGC5: Automatic Gain Control Register 5

Register Name: AGC5 Register Address: 0x1B

bit7-RW-0 bit6-RW-0 bit5-RW-0 bit4-RW-0 bit3-RW-0 bit2-RW-0 bit1-RW-0 bit0-RW-0

Reserved AGC_MIN

Bits	Field	Description		
7:5	Reserved	These bits are not used, when read is 000.		
4:0	AGC_MIN	Maximum Gain Value to apply to the ADC path		
		00000 = 0 dB		
		00001 = 1.5dB		
		by step of 1.5dB		
		01111 = 22.5dB		
		10000 = 23 dB		
		10001 = 23 dB		
		10010 = 23 dB		
		10011 = 24.5dB		
		by step of 1.5dB		
		11111 = 42.5dB		

Note:

Please refer to section <u>2.7 AGC system guide</u> for more details.

18.6.2.26 TR1: Test Register 1

Register Name: TR1 Register Address: 0x14

bit7-RW-0	bit6-RW-0	Bit5-RW-0	bit4-RW-0	bit3-RW-0	bit2-RW-0	bit1-RW-0	bit0-RW-0
STBYO	STBYI	TSTDAC	TSTADC	TEST	STOPULL	NOSC	FAST_ON

Bits	Field	Description			
7	STBYO	Analog output stage power down mode			
		0 in normal mode			
6	STBYI	Analog input stage power down mode			
		0 in normal mode			
5	TSTDAC	DAC analog test mode			
		0 in normal mode			
4	TSTADC	ADC analog test mode			
		0 in normal mode			
3	TEST	Test mode			
		0 in normal mode			

2	STOPULL	Disables the input circuitry starting system		
		0 in normal mode		
1	NOSC	Disable the output short circuit protection		
		0 in normal mode		
0	FAST_ON	Disables the pop reduction internal mechanisms		
		0 in normal mode		

NOTE:

- 1. This is only used for testing. Change these value may cause damage.
- 2. This is a test register which value must clear to 00000000 as the reset value in the normal mode.

18.6.2.27 TR2: Test Register 2

Register Name: TR2 Register Address: 0x15

bit7-RW-1	bit6-RW-1	Bit5-RW-0	bit4-RW-0	bit3-RW-0	bit2-RW-0	bit1-RW-0	bit0-RW-0
FAENDAC	FAENADC	NENCOMP	Reserved	NODEM	HIPAS	NO_RST	UNSTBL

Bits	Field	Description			
7	FAENDAC	Flow adapter command control bit (DAC path)			
		0 = inactive			
		1 = enables the flow adapter working mode			
6	FAENADC	Flow adapter command control bit (ADC path)			
		0 = inactive			
		1 = enables the flow adapter working mode			
5	NENCOMP	Biasing bit control			
		0 in normal mode			
4	Reserved	This bit are not used, when read is 0.			
3	NODEM	DAC DEM control			
		0 in normal mode			
2	HIPAS	ADC NTF test control			
		0 in normal mode			
1	NO_RST	ADC auto reset control			
		0 in normal mode			
0	UNSTBL	ADC instability status			
		0 = reset of the status bit			

NOTE:

- 8. This is only used for testing. Change these value may cause damage.
- 9. This is a test register which value must set to 11000000 as the reset value in the normal mode.

18.6.3 Programmable gains

This section helps you to configure the programmable gain amplifier in the CODEC.

Internal signal VREFP is connected to AVDCDC Pin and internal signal VREFN is connected to AVSCDC Pin.

In this section, VREF equals to (VREFP - VREFN).

18.6.3.1 Programmable boost gain: GIM

In the same way, the following table gives the relation between the gain and the input level for the microphone input amplifier when GI = 0000

GIM	GIM Gain value (dB) Maximum inpu	
0	0	0.85*VREF
1	20	0.085*VREF

Note:

- 1. Maximum analog input amplitude value is given in Vpp differential.
- Maximum analog input amplitude is referenced as Full Scale (FS). After conversion, the
 corresponding digital code of the output value varies from 0x7FFF down to 0x8000 for a 16-bit word. When
 the analog input amplitude is greater than FS, the dynamic characteristics are not guaranteed.

18.6.3.2 Programmable input attenuation amplifier: PGATM

The gain of PGATM may be programmed through GI[3:0]. The value of the gain is programmable from 0 to 22.5dB with a pitch of 1.5dB.

The gain and input levels are obtained according to the following table:

GI[3:0]	Decimal	Gain (dB)	Maximum input amplitude
0 0 0 0	0	0	0.85*VREF
0 0 0 1	1	1.5	0.715*VREF
0 0 1 0	2	3	0.602*VREF
0 0 1 1	3	4.5	0.506*VREF
0 1 0 0	4	6.0	0.426*VREF
0 1 0 1	5	7.5	0.358*VREF
0110	6	9.0	0.302*VREF
0111	7	10.5	0.254*VREF
1000	8	12.0	0.214*VREF
1 0 0 1	9	13.5	0.180*VREF
1010	10	15.0	0.151*VREF
1011	11	16.5	0.127*VREF
1100	12	18.0	0.107*VREF
1101	13	19.5	0.090*VREF

1110	14	21.0	0.076*VREF
1111	15	22.5	0.064*VREF

The last column of the table gives the maximum analog input to be applied on the MICi inputs. The value is given in Vpp differential. These values refer to the external voltage reference VREF equals to (VREFP – VREFN). The voltage levels depend on the VREF voltage.

18.6.3.3 Programmable attenuation: GOi

The attenuation of analog bypass path may be programmed independently for each channel through GO1L[4:0], GO1R[4:0], GO2L[4:0], GO3L[4:0], GO3R[4:0]. The value of the gain is programmable from +6 to -22.5dB with a constant pitch as below.

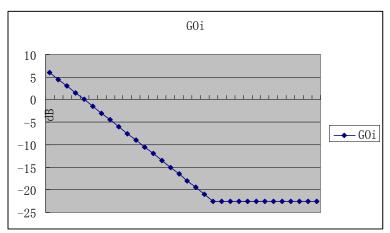

Figure 18-3 GOi values

The gain and output levels are obtained according to the following table:

Goi[4:0]	Decimal Value	Gain (dB)	Maximal input amplitude	Maximal output amplitude
00000	0	+6.0	0.425*VREF	0.71*VREF
00001	1	+4.5	0.506*VREF	0.71*VREF
00010	2	+3.0	0.602*VREF	0.71*VREF
00011	3	+1.5	0.715*VREF	0.71*VREF
00100	4	+0	0.85*VREF	0.71*VREF
00101	5	-1.5	0.85*VREF	0.597*VREF
00110	6	-3.0	0.85*VREF	0.503*VREF
00111	7	-4.5	0.85*VREF	0.423*VREF
01000	8	-6.0	0.85*VREF	0.356*VREF
01001	9	-7.5	0.85*VREF	0.299*VREF
01010	10	-9.0	0.85*VREF	0.252*VREF
01011	11	-10.5	0.85*VREF	0.212*VREF
01100	12	-12.0	0.85*VREF	0.178*VREF
01101	13	-13.5	0.85*VREF	0.150*VREF

01110	14	-15.0	0.85*VREF	0.126*VREF	
01111	15	-16.5	0.85*VREF	0.106*VREF	
10000	16	-18.0	0.85*VREF	0.089*VREF	
10001	17	-19.5	0.85*VREF	0.075*VREF	
10010	18	-21.0	0.85*VREF	0.063*VREF	
10011	19	-22.5	0.85*VREF	0.053*VREF	
		-22.5	0.85*VREF	0.053*VREF	
11111	31	-22.5	0.85*VREF	0.053*VREF	

- 1 Maximal input amplitude and output amplitude value is Vpp single-ended.
- 2 Maximal input amplitude is the maximal value at input of Mixer on one of analog bypass or sidetone paths with no signal on DAC path.
- 3 Maximal output amplitude is the maximal value at output of Headphone, with no signal on DAC path.

18.6.3.4 Programmable attenuation: GOD

The attenuation of DAC path may be programmed independently for both channels through the pins GODL[3:0] and GODR[3:0]. The value of the gain is programmable from 0 to –22.5dB with a constant pitch as below.

GOD[3:0]	Decimal	Gain (dB)	Output amplitude ^[*2]
0 0 0 0	0	0	0.71*VREF
0 0 0 1	1	-1.5	0.597*VREF
0010	2	-3.0	0.502 * VREF
0 0 1 1	3	-4.5	0.423*VREF
0100	4	-6.0	0.356*VREF
0101	5	-7.5	0.299*VREF
0110	6	-9.0	0.252*VREF
0111	7	-10.5	0.212*VREF
1000	8	-12.0	0.178*VREF
1001	9	-13.5	0.150*VREF
1010	10	-15.0	0.126*VREF
1011	11	-16.5	0.106*VREF
1100	12	-18.0	0.089*VREF
1101	13	-19.5	0.075*VREF
1110	14	-21.0	0.063*VREF
1111	15	-22.5	0.053*VREF

Note:

- 1. Output amplitude value is Vpp single-ended.
- 2. Output amplitude value is the value at output of headphone, for maximal amplitude 0.85*VREF (Vpp single-ended) at input of Mixer on DAC path, and no signal on Bypass path.

18.6.3.5 Programmable output amplifier: PGAT

The attenuation of PGAT may be programmed independently for the both channels through the registers bits GOL[4:0] and GOR[4:0]. The value of the gain is programmable from +4.5 to -33.5dB with a variable pitch as below:

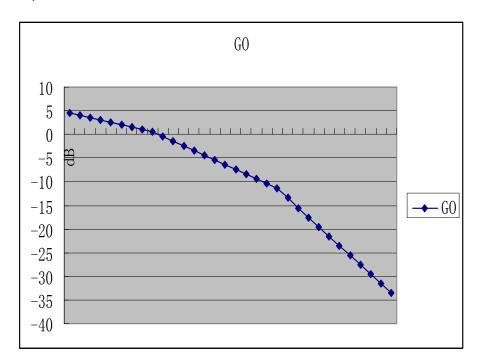

Figure 18-4 GO values

The gain and output levels are obtained according to the following table:

GO[4:0]	Decimal	Gain (dB)	Maximal PGAT input amplitude [*1]	Maximal PGAT output amplitude ^(*1)
00000	0	+4.5	0.425*VREF	0.71*VREF
00001	1	+4.0	0.451*VREF	0.71*VREF
00010	2	+3.5	0.478*VREF	0.71*VREF
00011	3	+3.0	0.506*VREF	0.71*VREF
00100	4	+2.5	0.536*VREF	0.71*VREF
00101	5	+2.0	0.568*VREF	0.71*VREF
00110	6	+1.5	0.602*VREF	0.71*VREF
00111	7	+1.0	0.637*VREF	0.71*VREF
01000	8	+0.5	0.675*VREF	0.71*VREF
01001	9	-0.5	0.757*VREF	0.71*VREF
0 1 0 10	10	-1.5	0.85*VREF	
01011	11	-2.5	0.85*VREF	
01100	12	-3.5	0.85*VREF	

01101	13	-4.5	0.85*VREF	
01110	14	-5.5	0.85*VREF	
01111	15	-6.5	0.85*VREF	
10000	16	-7.5	0.85*VREF	
10001	17	-8.5	0.85*VREF	
10010	18	-9.5	0.85*VREF	
10011	19	-10.5	0.85*VREF	0.251*VREF
10100	20	-11.5	0.85*VREF	0.225*VREF
10101	21	-13.5	0.85*VREF	0.178*VREF
10110	22	-15.5	0.85*VREF	
10111	23	-17.5	0.85*VREF	
11000	24	-19.5	0.85*VREF	
11001	25	-21.5	0.85*VREF	
11010	26	-23.5	0.85*VREF	
11011	27	-25.5	0.85*VREF	
11100	28	-27.5	0.85*VREF	
11101	29	-29.5	0.85*VREF	
11110	30	-31.5	0.85*VREF	0.023*VREF
11111	31	-33.5	0.85*VREF	0.017*VREF

- 1. Maximal PGAT input amplitude and output amplitude value is Vpp single-ended.
- 2. If the gain set to the value which is in the table cells in gray background, it may generated slight POP noise.

When the values of GO inputs are changed, the analog output amplitude is stabilized after about 1ms. The last column of the table gives the analog output voltage delivered on the AOHPL, AOHPR outputs and corresponding to a digital input at FS (Full Scale). The value is given in Vpp single-ended. These values refer to the external voltage reference VREF equals to (VREFP – VREFN). The voltage levels depend on the VREF voltage.

18.6.4 Sampling frequency: FREQ

The sampling frequency value is given in the FREQ[3:0] table below.

FREQ [3:0]	Sampling Rate (Fs)		
0000	96kHz		
0001	48kHz		
0010	44.1kHz		
0011	32kHz		
0100	24kHz		
0101	22.05kHz		

0110	16kHz
0111	12kHz
1000	11.025kHz
1001	9.6kHz
1010	8kHz
1011	8kHz
1100	8kHz
1101	8kHz
1110	8kHz
1111	8kHz

The sampling rate settings are the same as 8khz from 1010 to 1111, so the setting of FREQ from 1011 to 1111 could be ignored.

18.6.5 Programmable data word length

The Data Word Length block (DWL) allows selecting the length of the input data and of the output data between 24-/20-/18-/16-bit thanks to CR2.DAC_ADWL and CR2.ADC_ADWL (respectively for the DAC and ADC paths) in accordance with the following table:

*ADWL[1:0]	Word length
0 0	16-bit word length data
0 1	18-bit word length data
1 0	20-bit word length data
1 1	24-bit word length data

The size of the buses is always 24 bits, but the input/output data only use the number of MSB programmed with ADWL. The LSB are considered as '0' in input and set to '0' in output. The capability to use a data word length of 16 bits is kept for compatibility with standard applications.

18.6.6 Ramping system guide

An internal mechanism is used to reduce output glitches when the headphone stage enters or leaves the power-down mode.

When the SB_OUT is set to '1', the headphone output voltages (AOHPL, AOHPR, and AOHPM) are slowly decreased in the same time from AVDHP/2 down to 0. The output ramp waveform is programmable thanks to the CRR register.

When the SB_OUT is set to '0', the headphone output voltages (AOHPL, AOHPR, and AOHPM) are slowly increased in the same time from 0 to AVDHP/2.

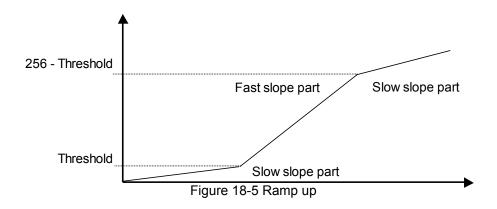

An interrupt request is sent when the ramp completes.

Do not change the level of SB OUT as long as the sequence due to the previous change is not complete or working not guaranteed.

In order to prevent audible glitch, it is required to power-down the output stage (SB OUT=1) before changing the type of output load (capacitor less load or capacitor coupled load) with SB MC.

The ramp time depends on the RATIO, KFAST and TRESH that are located in CRR register. CRR.RATIO set the Ratio; CRR.KFAST means the fast ratio and set the K_{fast}; CRR.TRESH means the threshold and set the TH.

Note:

 $\mathsf{T}_{\mathsf{ramp}}$

when CRR.TRESH = 11, the counter stays 2*Tslowstep on 127 at the middle of the falling and 2*Tslowstep on 128 at the middle of the rising.

The step count unit clock cycle length is called T_{step} , T_{step} = 39.16us at SYS_CLK = 12MHz. If using the CRR reset value, the default Ramp Time duration is 224ms, and should keep this value.

The time parameters is calculate by the following formulas and finally get the total ramp time T_{ramp}

Step time on fast part = $K_{fast} * T_{step}$ Step time on slow part = Ratio * K_{fast} * T_{step} T_{faststep} = K_{fast} * T_{step} = Ratio * K_{fast} * T_{step} T_{slowstep} = $K_{fast} * T_{step} * (256 - 2 * TH) + R * K_{fast} * T_{step} * 2 * TH$

18.6.7 AGC system guide

For the microphone input to ADC path, an Automatic Gain Control (AGC) system allows to optimize the signal swing at the input of the ADC.

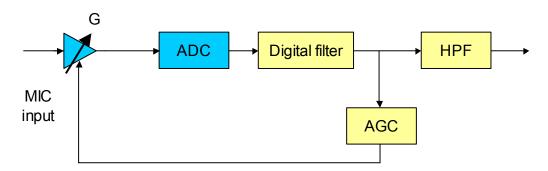

Figure 18-6 AGC Function Block Diagram

The AGC circuit compares the output of the ADC to a level and increases or decreases the gain of the microphone preamplifier to compensate. The full dynamic range of the ADC can be used automatically if the audio from the microphone is to be output digitally through the ADC.

The AGC_EN register bit enables the AGC system. If using the AGC system, CR3.INSEL must be clear to 00.

If not using AGC system, AGC1.AGC_EN must be clear 0.

The AGC system is used at the MIC input, and the Cut Frequency of HPF filter is 300 Hz.

If the AGC system is enabled, the system of gain control will directly assign the values of the gains GIL, GIR (shown as G in Figure 2-4 AGC Function Block Diagram) of the PGATM and GIM of the MIC boost stage.

18.6.7.1 AGC operating mode

The AGC system adapts the gain stages (PGATM and MIC boost stage) in order to best reach a setting target that AGC1.TARGET sets the desired ADC output range level. The limits of the gain variation are set by AGC4.AGC_MAX and AGC5.AGC_MIN.

The AGC system should not alter the dynamic content of the signal, so AGC system is continuously adapting the gain to fit the target level. The hold time between two consecutives gain adjustments is modifiable by the AGC2.HOLD register value.

After this hold time, there are two conditions:

- a) If the output level is lower than AGC1.TARGET, the gain is increased step by step in accordance to the AGC3.DCY register value.
- b) If the output level is higher than AGC1.TARGET, the gain is decreased step by step in accordance to the AGC3.ATK register value.

The following figure illustrates the behavior of AGC system:

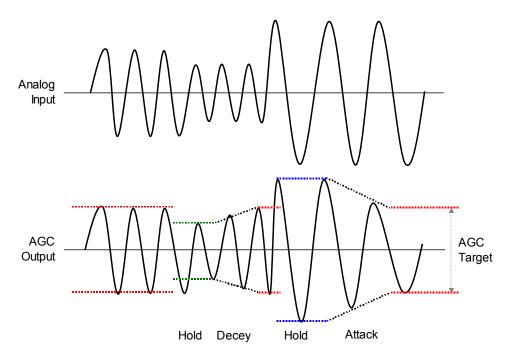

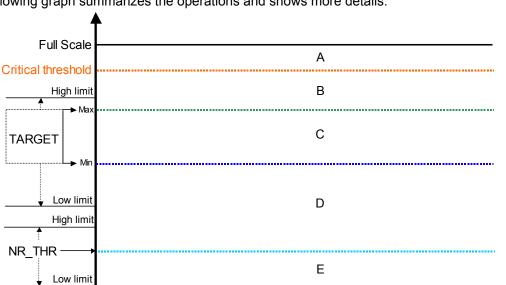

Figure 18-7 AGC adjusting waves

AGC system has a noise-gating feature to prevent gain increasing when no signal or small signal is present at the input, which is enabled using the AGC2.NG_EN register bit. And the noise gate threshold is set by the AGC2.NG_THR register value.

The following graph summarizes the operations and shows more details.

Figure 18-8 AGC adjust areas

The areas from A to E is deferent working area of AGC system, which is listing below:

- If the signal level is in this critical area: the AGC system decreases quickly the gain at the input of the ADC until the signal goes under the critical threshold.
- If the signal level remains in this area after the HOLD delay: the AGC system decreases the gain at the input of the ADC until the signal reaches the target area with a slope defined by AGC3.ATK register value.
- If the signal level is in this area: the AGC system does not perform gain adjustment. C:
- If the signal level remains in this area after the HOLD delay: the AGC system increases gain at the input of the ADC until the signal reach the target area with a slope defined by AGC3.DCY register value.
- If the signal level is in this range: the AGC system considers the signal as noise and does not perform gain adjustment.

18.6.8 CODEC Operating modes

Different operating modes are available:

Power-up mode: During power on time, CODEC is in this mode.

Reset mode: When NRST is low, CODEC is in this mode.

Soft mute mode: When CR1.DAC_MUTE is 1, CODEC is in this mode. Complete Power-down mode: After RESET, CODEC is in this mode. SLEEP modes: When PMR2.SB SLEEP is 1, CODEC is in this mode.

Normal mode: When CODEC is not in above mode, it is in this mode. This mode has three modes:

RECORD mode, REPLAY mode, RECORD_REPLAY mode.

The power diagram is shown below.

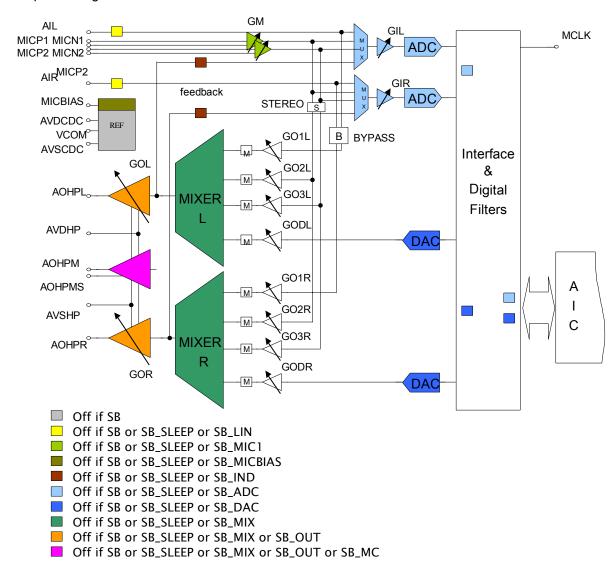

Figure 18-9 CODEC Power Diagram

There are many power parts of CODEC. Any part could be powered down independently.

18.6.8.1 Power-On mode and Power-Off mode

When the power supply ramps up, hiCODIv-9001-2G enters the power-on mode. During the reset, the CODEC is put in stand-by in order to reduce audible pops.

The CODEC doesn't handle the power supply ramp down on itself. The software has to turn the CODEC in complete stand-by mode before the power supply starts to ramp down.

18.6.8.2 RESET mode

The reset input signal is asynchronous; the reset minimum duration is one SYS_CLK cycle. During the power-up mode and system reset, the CODEC goes into Reset mode.

After system reset the CODEC will exit Reset mode and go to STANDBY mode.

NOTE:

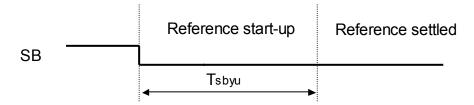

1. Except during the power-up mode, do NOT perform any reset in order to avoid audible pops.

2.Resetting the CODEC during normal operating mode will turn instantaneously the CODEC in STANDBY mode. This will lead to generate a large audible pop.

18.6.8.3 STANDBY mode

CODEC goes to STANDBY mode when the SB register bit equals '1', and all functions including ADC path, DAC path and analog references will stop and whole CODEC is shutdown for saving power. CODEC is complete down in this mode.

During the STANDBY mode, the power consumption is reduced to a minimum, so it is also called Complete Power-Down mode. When SB is set to '0', CODEC leaves the STANDBY mode. It is necessary to wait some time before the CODEC references settle. This time is called Tsbyu.

The typical value of T_{sbvu} is 250ms, maximizes 500ms(TBC).

18.6.8.4 Soft Mute mode

Soft Mute mode is used in order to reduce audible parasites when before the DAC enters or after leaves the Normal mode. Set the CR1.DAC_MUTE register bit to 1, it will go to Soft Mute mode.

Set CR1.DAC_MUTE to 1 puts the DAC in Soft Mute mode. The CODEC decreases progressively the digital gain from 0dB to $-\infty$. When the gain down sequence is completed, the signal of the DAC is equal to 0 whatever the value of the digital input data is. Then CODEC generates an interrupt and if ICR.GDD_MASK is 0, and set IFR.GAIN_DOWN_DONE register bit to 1.

During Soft Mute mode, the DAC is still converting but the output final voltages (AOL, AOR) are equal to VREF/2, so the differential of the Headphone voltage is zero that cause no sound output.

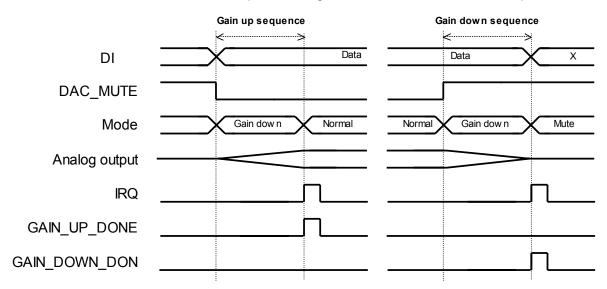

Figure 18-10 Gain up and gain down sequence

In the opposite, when CR1.DAC_MUTE is set to 0, the DAC leaves the Soft Mute mode by increasing progressively the digital gain from $-\infty$ to 0dB. When the gain up sequence is completed, the DAC returns in Normal mode. The CODEC then generates an interrupt and if ICR.GDD_MASK is 0, and set IFR.GAIN UP DONE register bit to 1.

After exiting Soft Mute mode, the DAC output will flow the DAC input data, and there is sound in the Headphone.

The duration of gain down and gain up sequences are nearly independent of Fs as shown below:

Fs(kHz)	Time(ms)	Fs(kHz)	Time(ms)	Fs(kHz)	Time(ms)
96	17.72	24	17.25	11.025	17.73
48	17.72	22.05	17.73	9.6	17.98
44.1	17.73	16	17.25	8	17.25
32	17.96	12	17.25		

Note:

- 1. Do NOT change the value of DAC_MUTE while the effect of the previous change is not reached, or the working is not guaranteed.
- 2. Do NOT enter in stand-by mode while the gain sequence is not completed, or the working is not guaranteed.

18.6.8.5 Power-Down mode and SLEEP mode

Twelve stand-by inputs allow putting independently the different parts of CODEC into Power-Down mode.

18.6.8.6 Working modes summary

Different working modes are sum-up in the following table (non exhaustive table):

Working Mode			SB_SLEEP	SB_DAC	SB_MIX	SB_OUT	SB_MC	SB_ADC		SB_LIN	SB_MIC1	SB IND	INSEL[1:0]	DACSEL	BYPASS	SIDETONE1	MICSTEREO	DIS	DAC_MUTE
0. Reset / Pow	er-On / Power_Off (After)	1	1	1	1	1	0	1	1	1	1	1	00	1	0	0	0	0	1
1. STANDBY		1	-	1	-	-	-	-	-	-	-	1	-	-	-	-	-	-	-
2. SLEEP		0	1	1	-	-	-	-	-	-	-	1	-	-	-	-	-	-	-
3. RECORD	Mono mic1 input	0	0	1	-	-	-	0	-	-	0	-	00	-	-	-	0	-	-
3. RECORD	Line input	0	0	1	-	-	-	0	-	0	-	-	10	-	-	-	-	-	-
	DAC to headphone	0	0	0	0	0	0	-	-	-	-	1	-	1	0	0	-	0	0
4. REPLAY	Line to headphone	0	0	1	0	0	0	-	-	0	-	1	-	0	1	0	-	0	-
4. REPLAY	Mic1 to headphone	0	0	1	0	0	0	-	-	-	0	-	-	0	0	1	0	0	-
	All inputs mix to headphone	0	0	0	0	0	0	-	0	0	0	1	-	1	1	1	-	0	0
	Playback with Record from Mic1	0	0	0	0	0	0	-	1	1	1	1	ı	1	0	0	1	0	0
	Playback with Record from Line	0	0	0	0	0	0	-	1	ı	ı	ı	ı	1	0	0	ı	0	0
5.RECORD_ REPLAY	Playback with Record from Mic1, Mixer	0	0	0	0	0	0	-	1	ı	ı	ı	ı	1	0	0	ı	0	0
	Playback with Record from Line, Mixer	0	0	0	0	0	0	-	-	-	ı	1	-	1	0	0	-	0	0
	Playback with Record from Mic1 with playback	0	0	0	0	0	0	-	ı	1	ı	ı	-	1	0	0	ı	0	0
Mixer output		0	0	ı	0	-	-	0	-	-	ı	0	11	-	ı	ı	ı	-	-
6. "Default mode" (for test)			0	0	0	0	0	0	1	0	1	1	00	1	0	0	0	0	0

Note:

- The '-' means don't care this bit, but most of them should be set to 1 for reduce power.

18.6.8.7 SYS_CLK turn-off and turn-on

The main clock of CODEC is called SYS_CLK, which is generated in CPM module and called cpm_i2s_sysclk.

During the SLEEP mode and the complete power-down mode, the main clock SYS_CLK may be

stopped to reduce the power consumption to the leakage currents only. In other modes, the main clock SYS CLK must not be stopped.

The main clock SYS_CLK must not be stopped until CODEC has reached the complete power-down mode and must be restarted before leaving the power-down mode.

18.6.8.8 Requirements on mixer and PGATM inputs selection and power-down modes

The following rules must be respected in order not to damage performances and to keep the functionality:

- If SB_LIN is set to 1, BYPASS must be equal to 0.
- If SB MIC1 or SB MIC2 is set to 1, SIDETONE1 and MICSTEREO must be equal to 0.
- If SB_DAC is set to 1, DACSEL must be equal to 0.

18.6.8.9 Anti-pop operation sequences

The main idea of this section is to describe the sequences to perform to minimize the audible pop to the minimum for the headphone output.

Due to the large number of stand-by combinations and to be the most flexible, the handling of the sequence from one working mode to another is left to the software. So for helping the software designer in this task, some specific sequences are automatically performed by CODEC and an interrupt mechanism (IRQ signal and associated registers) warns the application when these sequences end.

18.6.8.9.1 Initialization and configuration

To use the embedded CODEC with AIC, several AIC registers should be set up the below register of AIC before start the CODEC:

AICFR.ICDC = 1

AICFR.AUSEL = 1

AICFR.BCKD = 0

AICFR.SYNCD = 0

I2SCR.AMSL = 0

I2SCR.ESCLK = 1

18.6.8.9.2 Start up sequence

This sequence is from Power-on mode to CODEC REPLAY mode.

The intent of the following sequence is to prevent for large audible glitches due to the system start-up with the CODEC.

Before this sequence, setup the AIC properly.

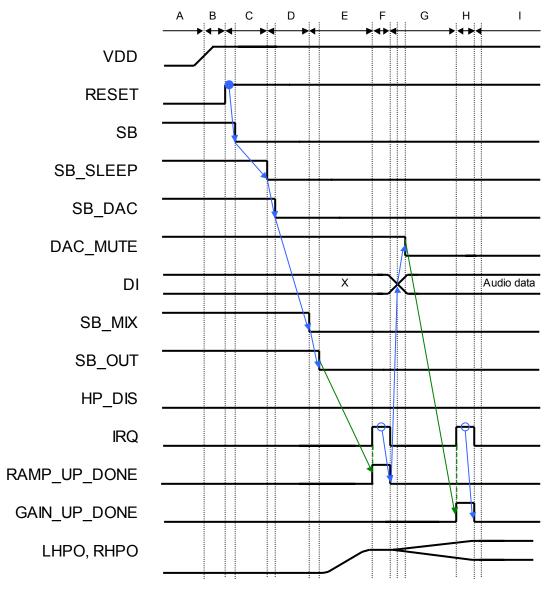

Figure 18-11 Start up sequence

- 1 The sequences in blue are manually handled by the software.
- The sequences in black are automatically handled by the CODEC.

A, Initial state:

The power supply is off.

B, Power supply ramp up:

The RESET of CODEC is '0' during system reset or other form reset.

C, Starting of CODEC reference:

The software turns the CODEC on SLEEP mode by clearing SB register bit to 0.

D: Turns on the DAC:

After waiting the Tsbyu duration (for example, on event generated by a timer at the software level),

the application turns on the DAC by clearing SB_SLEEP and SB_DAC register bits to 0

E, Ramp up cycle:

After waiting 1ms (TBC), the software turns on the mixer and the headphone output stages by clearing SB_MIX, SB_OUT to 0.

F, IRQ generation:

Once the ramp up cycle completes, the CODEC sets the RAMP_UP_DONE flag to 1 and generates an interrupt.

G, IRQ handling and gain up cycle:

The software handles the interrupt and resets the RAMP_UP_DONE flag and releases the mute of the DAC by clearing DAC_MUTE register bit to 0.

In the same time, the software sends valid audio data to the DAC.

H, IRQ generation:

Once the gain up cycle completes, the CODEC sets the GAIN_UP_DONE flag to 1 and generates an interrupt.

I, IRQ handling and active mode:

The software handles the interrupt and resets the GAIN_UP_DONE flag The DAC is now fully activated.

The sequence from C to I can be used to switch from the Stand-by mode to the active mode such as REPLAY mode.

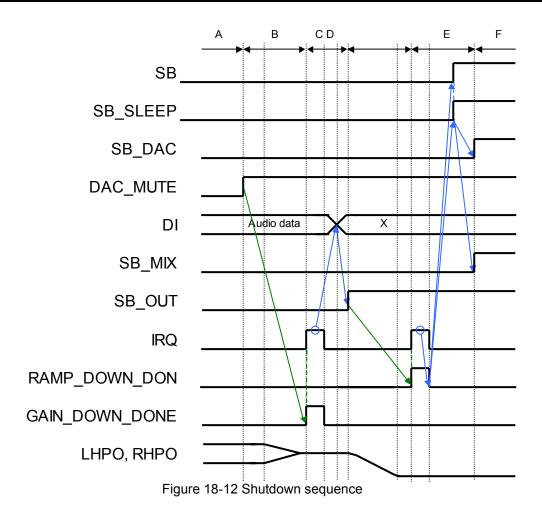

The sequence from D to I can be used to switch from the SLEEP mode to the active mode such as REPLAY mode.

18.6.8.9.3 Shutdown sequence

This sequence is from CODEC REPLAY mode to STANDBY mode.

The intent of the following sequence is to prevent for large audible glitches due to the system shutdown with the CODEC.

- 1. The sequences in blue are handled by the software.
- 2. The sequences in black are automatically handled by the CODEC.

A: Initial state:

It's a long time after the power supply on; CODEC is in REPLAY mode and DAC is activated.

B. Gain down cycle:

The software activates the mute of the DAC by setting DAC_MUTE register bit to 1; Once the gain down cycle completes, the CODEC sets the GAIN_DOWN_DONE flag to '1' and generates an interrupt.

C, IRQ handling and ramp down cycle:

The software handles the interrupt and resets the GAIN_DOWN_DONE flag; The software then turns off DAC output stage by setting SB_OUT register bit to 1.

D, IRQ generation:

Once the ramp down cycle completes, the CODEC sets the RAMP_DOWN_DONE flag to '1' and generates an interrupt.

E, IRQ handling:

The software handles the interrupt and resets the RAMP_DOWN_DONE flag;

The software turns off the DAC by setting SB MIX, SB DAC register bits to 1;

The software turns off the CODEC by setting the SB_SLEEP, SB register bits to 1.

F, Ideal:

Now, the CODEC is in STANDBY Mode.

18.6.9 Circuits design suggestions

This section lists a few PCB design suggestions with difference using mode.

18.6.9.1 Avoid quiet ground common currents

18.6.9.1.1 References pins

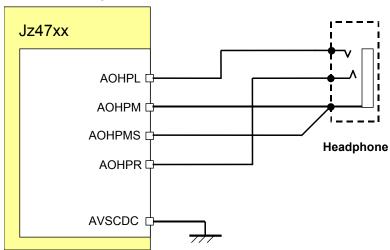

To work properly, CODEC requires few additional external components.

CODEC includes an internal voltage reference based on a resistive potential divider connected between AVDCDC and AVSCDC. For a correct working, it is required to connect two decoupling capacitor (10µF tantalum and 100nF ceramic) called Cext between the pins VREF and AVSCDC.

18.6.9.1.2 Power supply pins

CODEC analog power supplies require external decoupling capacitors. For each power supply, one 100nF ceramic has to be used. The ceramic capacitor has to be kept as close as possible to IC package (closer than 0.2 inch). One tantalum has to be used to decouple the analog power supply provided to the CODEC. Its value depends on the power supply generator; its typical value is between 1uF and 10uF. Ideally use separate ground planes for analog and digital parts.

Connect all ground pins with thick traces to power plane in order to ensure lowest impedance connections.

18.6.9.2 Capacitor-less headphone connection

Figure 18-13 Capacitor-less connection

The AOHPL and AOHPR pins are applied directly to the loads. The ground of the headphone is connected to AOHPM.

The DC value of the signal AOHPL or AOHPR equals to AVDCDC/2.

AOHPM and AOHPMS have to be connected together as close as possible of the headphone connector.

18.6.9.3 Capacitor-coupled headphone connection

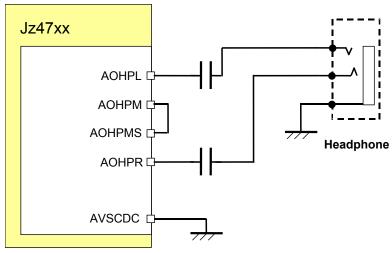

Figure 18-14 Capacitor-coupled connection

The AOHPL and AOHPR pins are connected to the headphone through an external bypass capacitor which is a DC blocking capacitors.

This capacitor is called C_L . When the headphone resistance R_L is 16 Ohm, C_L equals 200 uF to 1 uF. The DC value of the signal AOHPL or AOHPR equals to AVDCDC/2.

The ground of the headphone is connected to AVSCDC.

18.6.9.4 Microphone connection

This section is talking about single-ended microphone connection with single-ended microphone input.

Specific value of resistor (R, commonly from 2.2 kOhm to 4.7 kOhm) and Vmicbias (usually from 1 to 2V or more) depends on the selected EC (Electret Condenser) microphone.

The 1nf decoupling capacitance removes high frequency noise of the chip.

Setting SB_MIC1/SB_MIC2 to 1 will close microphone input path for saving power, also setting SB_MICBIAS to 1 will close MICBIAS stage and the MICBIAS output voltage will be zero.

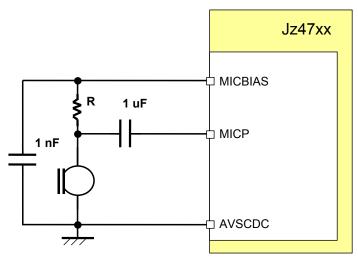

Figure 18-15 MIC connection with MICBIAS

MICBIAS output voltage scales with AVDCDC, equals to 5/6*AVDCDC (typical 2.75v).

MICBIAS output current is 4mA max.

MICBIAS output noise is 40uVrms max.

Of cause, If there is more accurate V_{MICBIAS} off the chip, should use the circuit shown below:

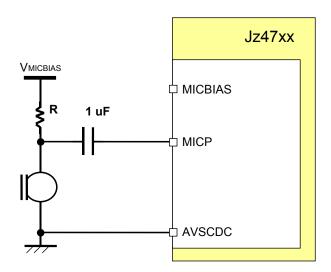

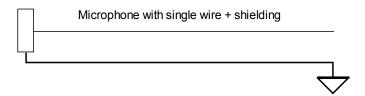

Figure 18-16 MIC connection with external V_{MICBIAS}

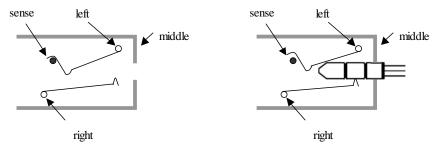

This configuration is better suited for microphone with single wire + shielding.

The AVSCDC Pin is connected the analog quiet reference ground in the chip (refers to <u>2.9.5 Grounds</u> <u>and analog signal references</u>). So the ground of MIC must be connected to AVSCDC using a star connection.

18.6.9.5 Description of the connections to the jack

When the jack is inserted, "sense" and "left" are disconnected. The "left" pin is connected to AOHPL, "right" pin is connected to AOHPR, and the "sense" pin is connected to HPSENSE.

18.6.9.6 Grounds and analog signal references

In order to limit the parasitic disturbances from the AVSHP output power supplies to inter VREFN quiet ground(which is using AVSCDC pin), should use the following principle to distribute the grounds.

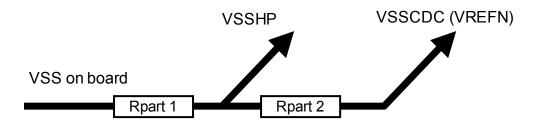

Figure 18-17 Ground distributing

Minimize the values of the connections parasitic resistance Rpar1, Rpar2.

Take a special care for Rpar1 in order to limit the disturbance from the output stages (AVSHP) to the signal reference (VREFN).

The reference of the input signals must be connected to VREFN (quiet ground which using the AVSCDC pin) using a star connection.

In the chip, The AVSHP and AVSCDC pin is very close, so could connect together with out this reference, please refer to <u>2.9.6 PCB considerations</u>.

18.6.9.7 PCB considerations

The reference PCB design is shown below:

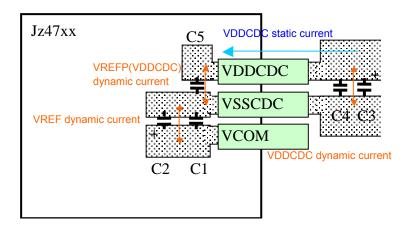

Figure 18-18 the bottom corner of chip PCB Layer

C1, C2, C3, C4 and C5 are defined in section <u>2.9.7 Required external components</u>.

This is just an example reference. You should change and select the PCB layer and route with your design constraints.

18.6.9.8 Required external components

The following table summarizes the external components required for a proper working of CODEC, except those used for the analog input and output signals.

Name	Description	Typical Value	Unit
C1	Ceramic reference decoupling capacitor. Cext	100	nF
C2	Tantalum reference decoupling capacitor. Cext	4.7	uF
C3	Tantalum analog power supply decoupling capacitor	1 to 10	uF
C4	Ceramic AVDCDC decoupling capacitor.	100	nF
C5	Ceramic inter signal VREFP decoupling capacitor (1)	100	nF
C6	Ceramic AVDHP decoupling capacitor. Not Used in <u>2.9.6 PCB</u> considerations.	100	nF
C7	MICBIAS decoupling capacitor, Refer to <u>2.9.4 Microphone connection</u> .	1	uF

19 SAR A/D Controller

19.1 Overview

The A/D embedded in this processor is a CMOS low-power dissipation 12bit SAR analog to digital converter. It operates with 3.3/1.8V power supply. Circuits needed by touch screen function and battery voltage measurement are also included.

The SAR A/D controller is dedicated to control A/D to work at three different modes: Touch Screen (measure pen position and pen down pressure), Battery (check the battery power), and SADCIN (external ADC input). Touch Screen can transfer the data to memory though the DMA or CPU. Battery and SADCIN can transfer the data to memory though CPU.

Features:

6 Channels

• Resolution: 12-bit

Integral nonlinearity: ±0.5 LSB
 Differential nonlinearity: ±0.4 LSB
 Resolution/speed: up to12bit 187.5ksps

Max Frequency: 8.0MHzPower-down current: 1uA

- Support touch screen measurement (Through pin XP, XN, YP, YN)
- Support voltage measurement (Through pin PBAT)
- Support external SAR-ADC input (Through pin SADCIN)
- Separate Channel Conversion Mode
- Single-end and Differential Conversion Mode
- Auto X/Y, X/Y/Z and X/Y/Z1/Z2 position measurement

19.2 Pin Description

Table 19-1 SADC Pin Description

Name	I/O	Description
XN	Al	Touch screen analog differential X- position input
YN	Al	Touch screen analog differential Y- position input
XP	Al	Touch screen analog differential X- position input
YP	Al	Touch screen analog differential Y- position input
ADIN0 (PBAT)	Al	Analog input for VBAT measurement
ADIN1 (SADCIN)	Al	External SAR-ADC input

19.3 Register Description

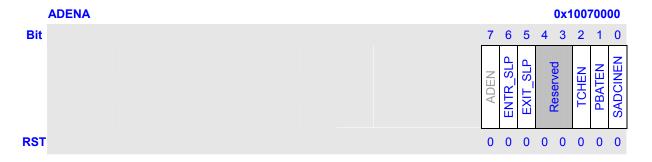

In this section, we will describe the registers in SAR A/D controller. Following table lists all the register definitions. All registers' 32bit addresses are physical addresses. And detailed function of each register will be described below.

Table 19-2 SADC Register Description

Name	Description	RW	Reset Value	Address	Access Size
ADENA	ADC Enable Register	RW	0x00	0x10070000	8
ADCFG	ADC Configure Register	RW	0x0002000C	0x10070004	32
ADCTRL	ADC Control Register	RW	0x3F	0x10070008	8
ADSTATE	ADC Status Register	RW	0x00	0x1007000C	8
ADSAME	ADC Same Point Time Register	RW	0x0000	0x10070010	16
ADWAIT	ADC Wait Time Register	RW	0x0000	0x10070014	16
ADTCH	ADC Touch Screen Data Register	RW	0x00000000	0x10070018	32
ADBDAT	ADC PBAT Data Register	RW	0x0000	0x1007001C	16
ADSDAT	ADC SADCIN Data Register	RW	0x0000	0x10070020	16
ADFLT	ADC Filter Register	RW	0x0000	0x10070024	16
ADCLK	ADC Clock Divide Register	RW	0x00000000	0x10070028	32

19.3.1 ADC Enable Register (ADENA)

The register ADENA is used to trigger A/D to work.

Bits	Name	Description	RW
7	ADEN ^{*1}	A/D Enable Control. (Only used in test mode)	RW
		Check the channel function of ADC. When A/D finish sampling the data,	
		ADEN will be cleared by hardware auto.	
		0: disable	
		1: enable	
6	ENTR_SLP	Enter SLEEP Mode Control.	RW
		Set this bit to 1 to initiate a process of entering the SLEEP mode. When the	

	Touch Screen is ready to enter the SLEEP mode. ENTR_SLP will be	
	cleared by hardware auto.	
EXIT_SLP	Exit SLEEP Mode Control.	RW
	Set this bit to 1 to initiate a process of exiting the SLEEP mode. After the	
	Touch Screen has exited from the SLEEP mode. EXIT_SLP will be cleared	
	by hardware auto.	
Reserved	These bits always read 0, and written are ignored.	R
TCHEN*2	Touch Screen Enable Control.	RW
	0: disable	
	1: enable	
PBATEN*2	PBAT Enable Control.	RW
	Sample the voltage of battery, PBATEN can be set to 1 no matter TCHEN is	
	disable or enable, and when the voltage of battery is ready. PBATEN will be	
	cleared by hardware auto.	
SADCINEN*2	SADCIN Enable Control.	RW
	Sample SADCIN, SADCINEN can be set to 1 no matter TCHEN is disable	
	or enable, and when SADCIN is ready, SADCINEN will be cleared by	
	hardware auto.	
	Reserved TCHEN*2 PBATEN*2	cleared by hardware auto. EXIT_SLP Exit SLEEP Mode Control. Set this bit to 1 to initiate a process of exiting the SLEEP mode. After the Touch Screen has exited from the SLEEP mode. EXIT_SLP will be cleared by hardware auto. Reserved These bits always read 0, and written are ignored. TCHEN*2 Touch Screen Enable Control. 0: disable 1: enable PBATEN*2 PBAT Enable Control. Sample the voltage of battery, PBATEN can be set to 1 no matter TCHEN is disable or enable, and when the voltage of battery is ready. PBATEN will be cleared by hardware auto. SADCINEN*2 SADCIN Enable Control. Sample SADCIN, SADCINEN can be set to 1 no matter TCHEN is disable or enable, and when SADCIN is ready, SADCINEN will be cleared by

- *1. When ADEN is set to 1, other bits cannot be set to 1 at the same time. This mode only used in test mode.
- *2. ENTR_SLP, TCHEN, PBATEN and SADCINEN can be set to 1 at the same time. The priority of the three mode is SADCIN > PBAT > ENTR_SLP > TCH.

19.3.2 ADC Configure Register (ADCFG)

The register ADCFG is used to configure the A/D.

Bits	Name	Description	RW
31	SPZZ*1	The $X_d Y_d Z_m Z_n$ of different point measure can be different.	RW
		But the $X_d Y_d Z_m Z_n$ of the same point measure can be same or different.	
		0: The $X_d Y_d Z_m Z_n$ of the same point measure is all the same.	
		$(X_dY_dZ1Z2, X_dY_dZ1Z2, X_dY_dZ1Z2, X_dY_dZ1Z2 X_dY_dZ1Z2)$	
		1: The $X_d Y_d Z_m Z_n$ of the same point measure maybe different.	
		$(X_dY_dZ1Z2, X_dY_dZ3Z4, X_dY_dZ3Z4, X_dY_dZ1Z2 X_dY_dZ1Z2)$	

30	EV INI	Change ovter	aal drivar a	or internal drive	Ar.	RW		
30	EX_IN			or internal drive	zi.	KVV		
			D: X_sY_s or X_sY_sZ 1: X_dY_d or X_dY_dZ					
		It is no use fo						
29:19	Dagamiad		is useful when ADCFG.XYZ = 00/01. hese bits always read 0, and written are ignored.					
	Reserved		-			R		
18:16	DNUM			sampled data	is the virtual value.	RW		
		Default: = 3'b		<u> </u>				
		DNU	JIVI		Number			
		3'b000		Reserved	- nd			
		3'b001			alue is the 2 nd sampled data			
		3'b010			alue is the 3 rd sampled data			
		3'b011			alue is the 4 th sampled data			
		3'b100			alue is the 5 th sampled data			
		3'b101			alue is the 6 th sampled data			
		3'b110	110 The virtual value is the 7 th sampled data					
		3'b111		The virtual va	alue is the 8 th sampled data			
15	DMA_EN	When A/D is t	When A/D is used as Touch Screen (CMD=1100), DMA_EN is used as					
		follows:						
		0: The sample	e data is re	ad by CPU				
		1: The sample	e data is re	ad by DMA				
14:13	XYZ	When A/D is a	used in Too	uch Screen mo	ode (CMD=1100), XYZ is used as	RW		
		follows:						
		XYZ	Measure	(EX_IN = 1)	Measure (EX_IN = 0)			
		00	$X_d \rightarrow Y_d$		$X_s \rightarrow Y_s$			
		01	$X_d \rightarrow Y_d \rightarrow$	·Z _s	$X_s \rightarrow Y_s \rightarrow Z_s$			
		10	$X_d \rightarrow Y_d \rightarrow$	Z1 _d →Z2 _d	$X_d \rightarrow Y_d \rightarrow Z1_d \rightarrow Z2_d$			
			or		or			
			$X_d \rightarrow Y_d \rightarrow$	Z3 _d →Z4 _d	$X_d \rightarrow Y_d \rightarrow Z3_d \rightarrow Z4_d$			
		11	Reserve	d	Reserved			
12:10	SNUM	The number of	f repeated	sampling one	point. When A/D is used as Touch	RW		
			-	NUM is used a				
		SNUM			Number			
		000	1					
		001	2					
		010	3					
		011	4					
		100	5					
		101	6					
		110	8					
		111	9					

9:5	Reserved	These bits always read 0, and written are ignored.						
4	BAT_MD	When AD is used as PBAT measure the following channel mode can be						
		chose to measu	chose to measure the battery power.					
		0: PBAT (full ba	attery voltage>=2.5V)					
		1: PBAT (full ba	attery voltage<2.5V)					
3:0	CMD	CMD is used to	CMD is used to choose the current sample command when adc_en_r is set R					
		to 1 (single cha	nnel test mode).					
		CMD	Function	Reference mode				
		0000	Measure X Position (X-plate is	Single-end				
			driven by external DC power)					
		0001	Measure Y Position (Y-plate is	Single-end				
			driven by external DC power)					
		0010	Measure X Position	Differential				
		0011	Measure Y Position	Differential				
		0100	Measure Z1 Position	Differential				
		0101	Measure Z2 Position	Differential				
		0110	Measure Z3 Position	Differential				
		0111	Measure Z4 Position	Differential				
		1000	Measure Touch Pressure Z	Single-end				
		1001	Measure PBAT (>=2.5V)	Single-end				
		1010	Measure PBAT (<2.5V)	Single-end				
		1011	Measure SADCIN	Single-end				
		1100						
		1101~1111	Reserved					

Note*1:

 $X_s,\,Y_s,\,Z_s$ means the reference mode of X, Y, Z is single-end mode.

X_d, Y_d, Z1_d, Z2_d, Z3_d, Z4d means the reference mode of X, Y, Z1, Z2, Z3, Z4 is differential mode.

When you measure Xs you need to make sure that X-plate is driven by external DC power.

When you measure Ys you need to make sure that Y-plate is driven by external DC power.

19.3.3 ADC Control Register (ADCTRL)

The register ADCTRL is used to control A/D to work.

Bits Name Description	RW
-----------------------	----

7:6	Reserved	These bits always read 0, and written are ignored.	R
5	SLPENDM	In SLEEP mode pen down interrupt mask.	RW
		0= enabled	
		1= masked	
4	PENDM	Pen down interrupt mask.	RW
		0= enabled	
		1= masked	
3	PENUM	Pen up interrupt mask.	RW
		0= enabled	
		1= masked	
2	DTCHM	Touch Screen Data Ready interrupt mask.	RW
		0= enabled	
		1= masked	
1	DRDYM	Data ready interrupt mask. (ADCEN = 1)	RW
		PBAT data ready interrupt mask.	
		0= enabled	
		1= masked	
0	SRDYM	SADCIN Data Ready interrupt mask.	RW
		0= enabled	
		1= masked	

19.3.4 ADC Status Register (ADSTATE)

The register ADSTATE is used to keep the status of A/D.

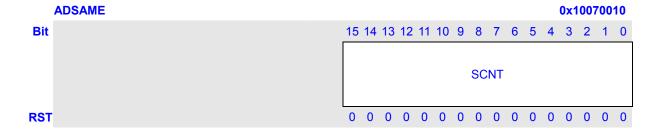

Bits	Name	Description	RW
7:6	Reserved	These bits always read 0, and written are ignored.	R
5	SLPEND	In SLEEP mode pen down interrupt flag. Write 1 to this bit, the	RW
		bit will clear this bit.	
		1: active	
		0: not active	
4	PEND	Pen down interrupt flag. Write 1 to this bit, the bit will clear this	RW
		bit.	
		1: active	
		0: not active	

3	PENU	Pen up interrupt flag. Write 1 to this bit, the bit will clear this bit.	RW
		1: active	
		0: not active	
2	DTCH	Touch screen data ready interrupt flag. Write 1 to this bit, the	RW
		bit will clear this bit.	
		1: active	
		0: not active	
1	DRDY	Data ready interrupt flag when ADCEN = 1.	RW
		PBAT data ready interrupt flag. Write 1 to this bit, the bit will	
		clear this bit.	
		1: active	
		0: not active	
0	SRDY	SADCIN Data ready interrupt flag. Write 1 to this bit, the bit will	RW
		clear this bit.	
		1: active	
		0: not active	

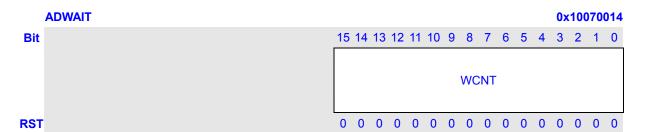

19.3.5 ADC Same Point Time Register (ADSAME)

The register ADSAME is used to store the interval time between repeated sampling the same point. The clock frequency of the counter is about 1/10us.

19.3.6 ADC Wait Pen Down Time Register (ADWAIT)

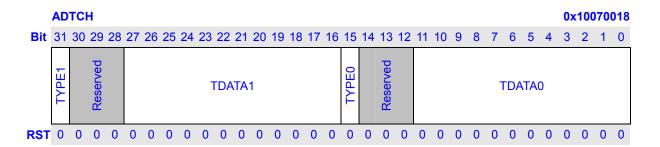

The register ADWAIT is used to store the interval time of wait pen down. And the register can be used as the interval time among the different point. The clock frequency of the counter is about 1/10us.

19.3.7 ADC Touch Screen Data Register (ADTCH)

The read-only ADTCH is corresponded to 2x32 bit FIFO, it keep the sample data for touch screen. 0~11 bits are data, 15 bit is data type. 16~27 bits are data, 31 bit is data type. When write to the register, DATA will be clear to 0.

Bits	Name	Description	RW
31	TYPE1	Type of the Touch Screen Data1.	RW
		When A/D is used as Touch Screen, ADCFG.XYZ=10	
		TYPE1=1: $X_d \rightarrow Y_d \rightarrow Z1 \rightarrow Z2$	
		TYPE1=0: $X_d \rightarrow Y_d \rightarrow Z3 \rightarrow Z4$	
		When A/D is used as Touch Screen, ADCFG.XYZ=00 or XYZ=01,	
		TYPE1=0.	
30:28	Reserved	These bits always read 0, and written are ignored.	R
27:16	TDATA1	The concert data of touch screen A/D.	RW
15	TYPE0	Type of the Touch Screen Data2.	RW
		When A/D is used as Touch Screen, ADCFG.XYZ=10	
		TYPE0=1: $X_d \rightarrow Y_d \rightarrow Z1 \rightarrow Z2$	
		TYPE0=0: $X_d \rightarrow Y_d \rightarrow Z3 \rightarrow Z4$	
		When A/D is used as Touch Screen, ADCFG.XYZ=00 or XYZ=01,	
		TYPE0=0.	
14:12	Reserved	These bits always read 0, and written are ignored.	R
11:0	TDATA0	The concert data of touch screen A/D.	RW

Note:

(1) When A/D is used as Touch Screen, EX_IN=0 and ADCFG.XYZ=00.

The format of touch screen data is as follows:

Type1	Reserved	Data1	Type0	Reserved	Data0
0	000	Y _s	0	000	X _s

(2) When A/D is used as Touch Screen, EX_IN=1 and ADCFG.XYZ=00.

The format of touch screen data is as follows:

Type1 Reserved	Data1	Type0	Reserved	Data0
----------------	-------	-------	----------	-------

C)	000	Yd	0	000	Xd
1 -			· u	*		u

(3) When A/D is used as Touch Screen, EX_IN=0 and ADCFG.XYZ=01.

The format of touch screen data is as follows:

Type1	Reserved	Data1	Type0	Reserved	Data0
0	000	Ys	0	000	X_s
0	000	00000000000	0	000	Z _s

Users need to read twice to get the whole data. The first time reading gets the data Y_s and X_s . The second time reading gets the data Z_s . The relation between "touch pressure" and " Z_s " are inverse ratio.

(4) When A/D is used as Touch Screen, EX_IN=1 and ADCFG.XYZ=01

The format of touch screen data is as follows:

Type1	Reserved	Data1	Type0	Reserved	Data0
0	000	Y _d	0	000	X_d
0	000	00000000000	0	000	Z _s

Users need to read twice to get the whole data. The first time reading gets the data Y_d and X_d . The second time reading gets the data Z_s . The relation between "touch pressure" and " Z_s " are inverse ratio.

(5) When A/D is used as Touch Screen, ADCFG.XYZ=11,TYPE=1

The format of touch screen data is as follows:

Ту	pe1 Reserve	ed Data	1 Туре	e0 Reserved	d Data0
1	000	Y_d	1	000	X _d
1	000	Z2 _d	1	000	Z1 _d

Users need to read twice to get the whole data. The first time reading gets the data Y_d and X_d . The second time reading gets the data $Z2_d$ and $Z1_d$.

The touch pressure measurement formula is as follows: (You can use formula 1 or formula 2.)

$$R_{\text{TOUCH}} = R_{\text{X-Plate}} \bullet \frac{\text{X-Position}}{4096} \left(\frac{Z_2}{Z_1} - 1 \right)$$
 (1)*

$$R_{\text{TOUCH}} = \frac{R_{\text{X-Plate}} \bullet \text{X-Position}}{4096} \left(\frac{4096}{Z_1} - 1\right) - R_{\text{Y-Plate}} \bullet \left(1 - \frac{\text{Y-Position}}{4096}\right)$$
 (2)*1

(6) When A/D is used as Touch Screen, ADCFG.XYZ=11,TYPE=0

The format of touch screen data is as follows:

Type1	Reserved	Data1	Type0	Reserved	Data0
0	000	Y _d	0	000	X _d
0	000	Z4 _d	0	000	Z3 _d

Users need to read twice to get the whole data. The first time reading gets the data Y_d and X_d . The second time reading gets the data $Z4_d$ and $Z3_d$.

The touch pressure measurement formula is as follows: (You can use formula 3 or formula 4.)

$$R_{\text{TOUCH}} = R_{\text{Y-Plate}} \bullet \frac{\text{Y-Position}}{4096} \left(\frac{Z_4}{Z_3} - 1 \right)$$
 (3)*

$$R_{\text{TOUCH}} = \frac{R_{\text{Y-Plate}} \bullet \text{Y-Position}}{4096} \left(\frac{4096}{Z_3} - 1\right) - R_{\text{X-Plate}} \bullet \left(1 - \frac{\text{X-Position}}{4096}\right) \tag{4}^{1}$$

Note*1:

To determine pen or finger touch, the pressure of the touch needs to be determined. Generally, it is not necessary to have very high performance for this test; therefore, the 8-bit resolution mode is recommended (however, calculations will be shown here are in 12-bit resolution mode).

 $R_{X-plate}$: Total X-axis resistor value (about 200 Ω ~ 600 Ω)

 $R_{Y\text{-plate}}$: Total Y-axis resistor value (about 200 Ω ~ 600 Ω)

X-Position: X-axis voltage sample value

Y-Position: Y-axis voltage sample value

Z1, Z2: Z1, Z2 voltage sample value

Z3, Z4: Z3, Z4 voltage sample value

19.3.8 ADC PBAT Data Register (ADBDAT)

The read-only ADBDAT is a 16-bit register, it keep the sample data of both "PBAT mode" and "Single channel check" mode. 0~11 bits are data.

ADBDAT	0x1007001C
Bit	15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0
	Reserved BDATA
RST	0 0 0 0 0 0 0 0 0 0 0 0 0 0 0

Bits	Name	Description	RW
15:12	Reserved	These bits always read 0, and written are ignored.	R
11:0	BDATA	Data of A/D convert when ADCEN = 1.	RW
		Data of PBAT A/D convert.	
402		When write te the register, DATA will be clear to 0.	

When ADCCFG.BAT_MD = 0 (full battery voltage>=2.5V), the measured voltage V_{BAT} is as follows:

$$V_{BAT} = \frac{BDATA}{4096} \bullet 7.5V$$

When ADCCFG.BAT_MD = 1 (full battery voltage <2.5V), the measured voltage V_{BAT} is as follows:

$$V_{BAT} = \frac{BDATA}{4096} \bullet 2.5V$$

It is recommended to connect a capacitance of about 0.1uF near to pin ADIN0 to have a more stable battery measurement and better ESD protection.

19.3.9 ADC SADCIN Data Register (ADSDAT)

The read-only ADSDAT is a 16-bit register, it keep the sample data. 0~11 bits are data.

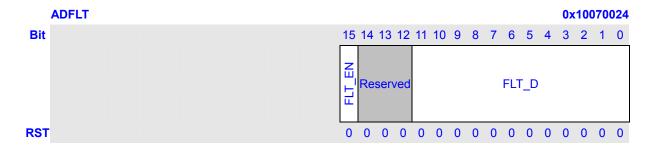

Bits	Name	Description	RW
15:12	Reserved	These bits always read 0, and written are ignored.	R
11:0	SDATA	Data of SADCIN A/D convert.	RW
		When write to the register, DATA will be clear to 0.	

The measured voltage V_{SADICN} is as follows:

$$V_{SADCIN} = \frac{SDATA}{4096} \bullet 3.3V$$

19.3.10 ADC Filter Register (ADFLT)

ADC Filter Register ADFLT is used for filter out the no valid point for Touch Screen control.

Bits	Name	Description	RW
15	FLT_EN	Filter enable bit.	RW
		1: Filter function enable	
		0: Filter function disable	
14:12	Reserved	These bits always read 0, and written are ignored.	R
11:0	FLT_D	Filter Data.	RW

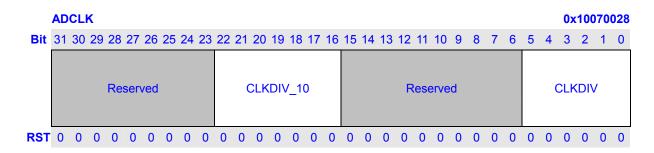

Note: When ADFLT.FLT_EN is set to 1,

If (|Z2-Z1|> ADFLT.FLT_D), X=Y=Z1=Z2=0;

If (|Z4-Z3|> ADFLT.FLT_D), X=Y=Z3=Z4=0;

19.3.11 ADC Clock Divide Register (ADCLK)

The register ADCLK is used to set the A/D's clock dividing number.

Bits	Name	Description	RW
31:23	Reserved	These bits always read 0, and written are ignored.	R
22:16	CLKDIV_10	Dividing number to get 10us clock from ADC clock.	RW
		CLKDIV_10 = adc_clk / 100K - 1	
		0 ≤CLKDIV_10 ≤127	
15:6	Reserved	These bits always read 0, and written are ignored.	R
5:0	CLKDIV	Dividing number to get ADC clock from device clock.	RW
		The A/D works at the frequency between 500KHz and 8MHz.	
		If CLKDIV = N, Then the freq of adc_clk = dev_clk / (N+1).	
		0 ≤ N ≤ 63	

19.4 SAR A/D Controller Guide

The following describes steps of using SAR-ADC.

- **19.4.1 Single Operation** (only used as a test mode to check the channel function)
- (1) Set ADTCTL to 0x1f to mask all the interrupt of SADC.
- (2) Set ADCFG.CMD to choose one CMD;(0000~1011)

- (3) Set ADCLK.CLKDIV and ADCCLK.CLKDIV_10 to set A/D clock frequency;
- (4) Set ADTCTL.PDEN to 0;
- (5) Set ADENA.ADEN to 1 to start A/D;
- (6) When ADSTATE.DRDY to 1, you can read the sample data from ADBDAT and ADENA.ADEN will be set to 0 auto.

19.4.2 A Sample Touch Screen Operation

(Pen Down → Sample some data of several points → Pen Up)

- (1) Set ADCTRL to 0x1f to mask all the interrupt of SADC.
- (2) Set DMA_EN to choose whether to use DMA to read the sample data out or to use CPU to read the sample data out;
- (3) Set ADCFG.SPZZ, ADCFG.EX_IN and ADCFG.XYZ to choose sample mode
 - 1: $X_s \rightarrow Y_s$ (Single-end X \rightarrow Single-end Y).
 - 2: $X_d \rightarrow Y_d$ (Differential $X \rightarrow$ Differential Y).
 - 3: $X_s \rightarrow Y_s \rightarrow Z_s$ (Single-end $X \rightarrow$ Single-end Z)
 - 4: $X_d \rightarrow Y_d \rightarrow Z_s$ (Differential $X \rightarrow$ Differential $Y \rightarrow$ Single-end Z)
 - $5:X_d \rightarrow Y_d \rightarrow Z1_d \rightarrow Z2_d$ or $X_d \rightarrow Y_d \rightarrow Z3_d \rightarrow Z4_d$ (Reference register ADCFG.SPZZ)
 - (Differential X→Differential Y→Differential Z1→Differential Z2 or Differential X→Differential Y→Differential Z3→Differential Z4,)
- (4) Set ADCLK.CLKDIV and ADCLK.CLKDIV_10 to set A/D clock frequency;
- (5) Set ADWAIT to decide the wait time of pen down and the interval time between sampling different points. This time delay is necessary because when pen is put down or pen position change, there should be some time to wait the pen down signal to become stable.
- (6) Set ADSAME to decide the interval time between repeated sampling the same point. User can repeat sampling one point to get the most accurate data.
- (7) Set ADCTRL.PENDM to 0 to enable the pen down interrupt of touch panel;
- (8) Set ADENA.TCHEN to 1 to start touch panel;
- (9) When pen down interrupt happened, you should set ADCTRL.PENDM to 1 and clear ADSTATE.PEND to close pen down interrupt. Then you should clear ADSTATE.PENDU and set ADCTRL.PENUM to 0 to enable pen up interrupt.
- (10) When pen down interrupt happened, the SAR ADC is sampling data. When ADSTATE.DTCH to 1, user must read the sample data from ADTCH. The SAR ADC will not sample the next point until the whole data of the one point are read (no matter by CPU or DMA). If ADCFG.XYZ is mode one and mode two, user only needs to read once to get the whole data. In other modes, user needs to read twice to get the whole data.
- (11) Repeat 10 till pen up interrupt happened.
- (12) When pen up interrupt happened, you should set ADCTRL.PENUM to 1 and clear ADSTATE.PENU. Then you should clear ADSTATE.PEND and set ADCTRL.PENDM to 0 to enable pen down interrupt.
- (13) Wait pen down interrupt and repeat from 9.
- (14) When you want to shut down the touch screen, user can set the ADENA.TCHEN to 0. If the last point is not sampled completely, user can abandon it.

19.4.3 SLEEP mode Sample Operation

- (1) Set ADCLK.CLKDIV and ADCLK.CLKDIV_10 to set A/D clock frequency.
- (2) Then you can set ADENA.ENTR_SLP to 1. When the Touch Screen is ready to enter the SLEEP mode, ADENA.ENTR_SLP will be cleared by hardware auto.
- (3) After that you should clear ADSTATE.SLPEND and set ADCTRL.SLPENDM to 0 to enable "in SLEEP mode pen down interrupt" and mask all other interrupts. Then you can execute the SLEEP instruction to enter the SLEEP mode.
- (4) When "in SLEEP mode pen down interrupt" happened, it will switch from the SLEEP mode to NORMAL. Then, you should set ADCTRL.SLPENDM to 1 and clear ADSTATE.SLPEND to close "in SLEEP mode pen down interrupt". And you should set ADENA.EXIT_SLP to 1. When the Touch Screen has exited from the SLEEP mode, EXIT_SLP will be cleared by hardware auto.
- (5) Then you can do any other operations.

19.4.4 PBAT Sample Operation

- (1) Set ADCLK.CLKDIV and ADCLK.CLKDIV_10 to set A/D clock frequency.
- (2) Set ADCFG.CH_MD to choose PBAT test mode channel.
- (3) Set ADENA.PBATEN to 1 to enable the channel.
- (4) When ADSTATE.DRDY = 1, you can read the sample data from ADBDAT. And the PBATEN will be set to 0 auto.

19.4.5 SADCIN Sample Operation

- (1) Set ADCLK.CLKDIV and ADCLK.CLKDIV_10 to set A/D clock frequency.
- (2) Set ADENA.SADCINEN to 1 to enable the channel.
- (3) When ADSTATE. SRDY = 1, you can read the sample data from ADSDAT. And the SADCINEN will be set to 0 auto.

Note:

Touch Screen mode can be interrupted by the PBAT and SADCIN mode and "In SLEEP mode pen down". And the priority is SADCIN > PBAT > ENTR_SLP > TOUCH. If SADCINEN or PBATEN or ENTR_SLP is set to 1 before or at the same time with TCHEN, SAR ADC will first work in SADCIN mode then in PBAT mode, then enter SLEEP mode and at last in touch screen mode (after exit SLEEP). If SADCINEN, PBATEN and ENTR_SLP are set to 1 after the TCHEN, the SAR ADC will work in touch screen mode first and finish sampling the same point completely then turn to the SADCIN, PBAT or SLEEP mode. And return to touch screen mode.

19.4.6 Use TSC to support keypad

SADC TSC function can apply to a keypad, if touch screen is not used. Suppose the keypad is a NxM matrix, where X direction has N key columns and Y direction has M key rows. Kij is used to indicate the key in ith column from left to right and jth row from bottom to top, where $i=0\sim(N-1)$ and $j=0\sim(M-1)$. Figure 19-1 is a 6x5 keypad circuit. The blue color is for X direction network and pink

color is for Y. The networks are composed by resistors and metal line. These two networks should be connected to SADC 4 pins: XP/XN/YP/YN as illustrated in the figure. The gray circle is the key. When no key pressing, X network and Y network is open circuit. When a key is pressed, the X network and Y network is shorted under the key position.

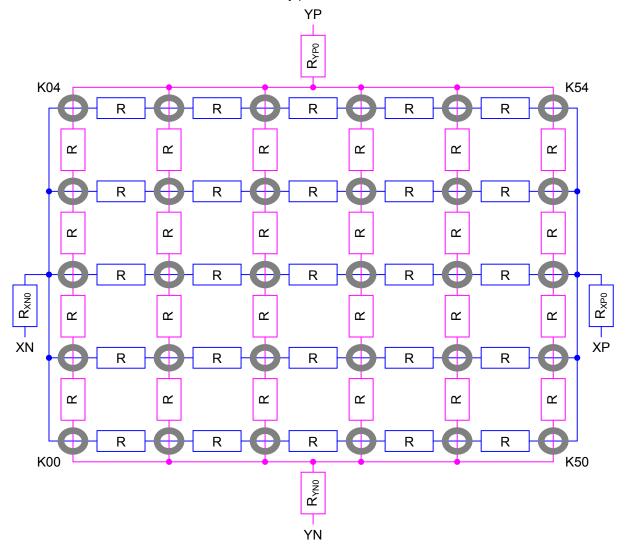

Figure 19-1 6x5 keypad circuit

When SADC is in waiting for pen-down status (C=1100), the equivalent circuit is show in Figure 19-2. When the key is not pressed, XP is open and the PEN is pulled to VDDADC, which is logic 1. When the key Kij is pressed, the circuit is: VDDADC \rightarrow (10k Ω resistor) $\rightarrow R_{XP} \rightarrow R_{YN} \rightarrow VSSADC$.

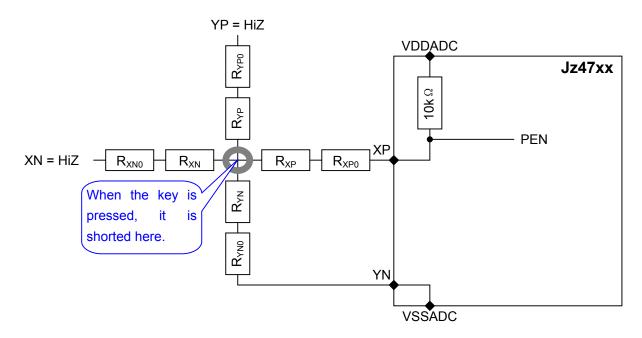

Figure 19-2 Wait for pen-down (C=1100) circuit

Where

$$R_{XP} = \frac{(N-1)^{2} - i^{2}}{M \times (N-1-i) + 2i} \times R$$

$$R_{YN} = \frac{j \times (2M - 2 - j)}{N \times j + 2M - 2 - 2j} \times R$$

To ensure logic 0 at PEN in this case, following formula should be obeyed.

$$R_{XP} + R_{YN} + R_{XP0} + R_{YN0} \le 3k\Omega \tag{1}$$

It is suggested the value of N and M is as close to each other as possible. For $N=2\sim20$, $M=2\sim20$ and M=(N-1, N or N+1), we found

$$R_{XP} + R_{YN} < 2.7 \times R \tag{2}$$

After key pressing is found, the key Kij location, columns and row, should be measured by using C=0010 and C=0011 respectively. The equivalent circuits are show in Figure 19-3 and Figure 19-4, where

$$\begin{split} R_{X0} &= \frac{N-1}{M-1} \times R \\ R_{Y0} &= \frac{M-1}{N-1} \times R \\ R_{XNi} &= i \times R \\ R_{XPi} &= (N-1-i) \times R \\ R_{YNj} &= j \times R \\ R_{YPi} &= (M-1-j) \times R \end{split}$$

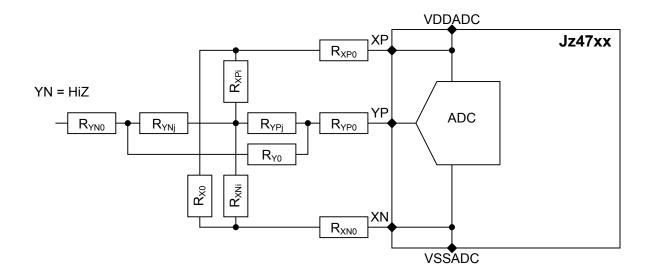

Figure 19-3 Measure X-position (C=0010) circuit

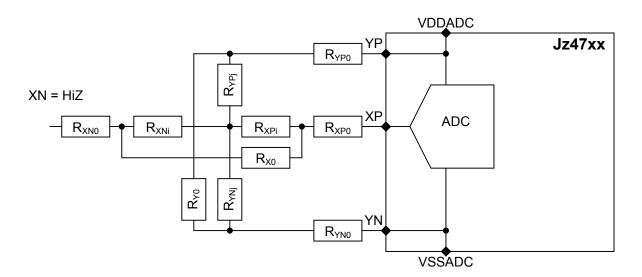

Figure 19-4 Measure Y-position (C=0011) circuit

So for Kij pressing, we should get ADC converted number Ni and Nj for i and j respectively.

$$Ni = \frac{R_{XN0} + \frac{i}{M}R}{R_{XN0} + \frac{N-1}{M}R + R_{XP0}} \times 4096$$

$$Nj = \frac{R_{YN0} + \frac{j}{N}R}{R_{YN0} + \frac{M-1}{N}R + R_{YP0}} \times 4096$$

It is required the resistor between XP and XN in case of C=0010, between YP and YN in case of C=0011, must be \geq 200 Ω and it better be \geq 500 Ω . Also consider the requirement in formula (1) and (2) above, we suggest to put R_{XP0} = R_{XN0} = R_{YP0} = R_{YN0} = 50 Ω or 100 Ω , put R = 500 Ω ~ 1k Ω .

To use the keypad, the software should set:

ADENA.TCHEN = 1 ADCFG.EX_IN = 1 ADCFG.XYZ = 00

The operation is similar to touch screen.

20 Camera Interface Module

20.1 Overview

The camera interface module (CIM) supports commonly available CMOS or CCD type image sensors. The CIM sources the digital image stream through a common 8-bit parallel digital protocol. The CIM can directly connect to external CMOS image sensors and ITU656 standard video decoders.

20.1.1 Features

- Input image size up to 4096x4096 pixels
- Max. VGA for image preview
- Max. VGA for video record
- Integrated DMA
- Supported data format: YCbCr 4:4:4, YCbCr 4:2:2 and other formats
- Supports ITU656 (YCbCr 4:2:2) input
- Configurable CIM_VSYNC and CIM_HSYNC signals: active high/low
- Configurable CIM_PCLK: active edge rising/falling
- 64x33 image data receive FIFO (RXFIFO)
- PCLK max. 80MHz
- Output format: csc mode is YCbCr 4:2:2, bypass mode is the input data format
- Configurable output order.

20.1.2 Pin Description

Table 20-1 Camera Interface Pins Description

Name	I/O	Description
CIM_MCLK	0	CIM work clock
CIM_PCLK	I	Pixel clock from Image Sensor
CIM_VSYNC	I	Vertical synchronous from Image Sensor
CIM_HSYNC	I	Horizontal synchronous from Image Sensor
CIM_DATA[7:0]	I	Data bus from Image Sensor

20.2 CIM Special Register

The special registers are for CIM to configure and control the interface and DMA operation. The table below lists these registers.

Table 20-2 CIM Registers

Name	RW	Reset Value	Address	Access Size
CIMCFG	RW	0x00000000	0x13060000	32
CIMCR	RW	0x00000000	0x13060004	32

Bits	Name		Description	RW									
31:20	EEOF_LINE	When EEOF	/hen EEOF_LINE lines data has been transferred of a frame, the										
		EEOF flag w	EOF flag will be set, and the EEOF interrupt will occur.										
19:16	FRC	CIM frame ra	CIM frame rate control. Specifies the sampling frame data rate. If										
		FRC = N, CI	RC = N, CIM sampling one frame of every N+1 frames from the										
		sensor. In th	ensor. In this way, CIM reduces the frame rate of sensor. Another										
		way to reduc	way to reduce frame rate is to decrease the MCLK frequency										
		output to the	image sensor.										
		FRC	Description										
		4'b0000	Sample every frame from the sensor										
		4'b0001	Sample 1 frame of every 2 frames from the sensor										
		4'b1110	Sample 1 frame of every 15 frames from the sensor										
		4'b1111 Sample 1 frame of every 16 frames from the sensor											

15	DMA_EEOFM	The control bit to enable EEOF interrupt.	RW									
14	WIN_En	To enable window-image. Used to indicate whether the registers	R									
		CIMSIZE and CIMOFFSET work or not.										
		0: the value in CIMSIZE and CIMOFFSET will be ignored.										
		1: the value in CIMSIZE and CIMOFFSET will be used.										
13	VDDM	The control bit to enable VDD interrupt.	RW									
		0 – disable; 1 – enable										
12	DMA_SOFM	The control bit to enable DMA_SOF interrupt.	RW									
		0 – disable; 1 – enable										
11	DMA_EOFM	The control bit to enable DMA_EOF interrupt.										
		0 – disable; 1 – enable										
10	DMA_STOPM	The control bit to enable DMA_STOP interrupt.	RW									
		0 – disable; 1 – enable										
9	RF_TRIGM	The control bit to enable RXF_TRIG interrupt.	RW									
		0 – disable; 1 – enable										
8	RF_OFM	The control bit to enable RXF_OF interrupt.	RW									
		0 – disable; 1 – enable										
7	DMA_SYNC	The control bit to enable DAM synchronization.	RW									
		0 – The valid data input to CIM will be transferred by DMA to										
		external memory;										
		1 – When a new descriptor-DMA transfer starts with writing										
		CIMDA, a frame synchronization will be done, and the data in										
		RXFIFO will be ignored,										
6:3	RF_TRIG	Specifies the trigger value of RXFIFO.	RW									
		CIMCFG.BURST_TYPE RF_TRIG = n										
		INCR4 Trigger value is (n + 1) * 4										
		INCR8 Trigger value is (n + 1) * 8										
		INCR16 Trigger value is (n + 1) * 16										
		Note: Trigger value should										
		be less then 64, and n is										
		suggested to 0.										
2	DMA_EN	Enable / disable the DMA function.	RW									
	_	0 – disable DMA; 1 – enable DMA										
1	RF_RST	RXFIFO software reset. Setting 1 to RXF_RST can reset RXFIFO	RW									
	_	immediately. Setting 0 to RXF_RST can stop resetting RXFIFO.										
		After reset, RXFIFO is empty.										
0	ENA	Enable / disable the CIM module. Setting 1 to ENA can enable	RW									
		CIM. When CIM is working, clear ENA to 0 can stop CIM										
		immediately.										
		0 – CIM is not enabled, or disable CIM immediately;										
		1 – CIM is enabled, or enabling CIM										

20.2.3 CIM Status Register (CIMST)

	CIN	/IST	•																										0x	130	600	80
Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
											R	ese	erve	d											DMA_EEOF	DMA_SOF	DMA_EOF	DMA_STOP	RF_OF	RF_TRIG	RF_EMPTY	VDD
RST	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	1	1	0	0	0	0	0	1	1	0	0	0	0	0

Bits	Name	Description	RW
31:8	Reserved		R
7	DMA_EEOF	When set to 1, indicate the DMA has transferred	
		CIMCTRL.EEOF_LINE lines data of a frame.	
		Write 0 to this bit to clear.	
6	DMA_SOF	When set to 1, Indicate the DMA start a transfer from RXFIFO to a	RW
		frame buffer.	
		Write 0 to this bit to clear.	
5	DMA_EOF	When set to 1, indicate the DMA complete a transfer from RXFIFO to	RW
		a frame buffer.	
		Write 0 to this bit to clear.	
4	DMA_STOP	When set to 1, indicate the DMA complete transferring data and stop	RW
		the operation. Can generate interrupt if CIMCR.DMA_STOPM bit is	
		set.	
		Write 0 to this bit to clear.	
3	RF_OF	RXFIFO over flow. When RXFIFO over flow happens, RXF_OF is set	RW
		1.	
		Can generate interrupt if CIMCR.RF_OFM bit is set.	
		Write 0 to this bit to clear.	
2	RF_TRIG	RXFIFO trigger. Indicates whether RXFIFO meet the trigger value or	R
		not. When the valid data number in RXFIFO reaches the trig value,	
		RXF_TRIG is set 1; when the valid data number in RXFIFO do not	
		reach the trig value, RXF_TRIG is set 0. Can generate interrupt if	
		CIMCR.RF_TRIGM bit is set.	
		0 – RXFIFO does not meets the trigger value;	
		1 – RXFIFO meets the trigger value	
1	RF_EMPTY	RXFIFO empty. Indicates whether RXFIFO is empty or not. After	R
		reset, RXFIFO is empty, and RXF_EMPTY is 1.	
		0 – RXFIFO is not empty;	
		1 – RXFIFO is empty	
0	VDD	CIM disable done. Indicate this module is disabled after clear the	RW
		CIMCR.ENA bit to disable the CIM module. Can generate interrupt if	

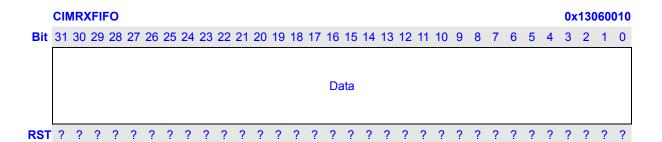

CIMCR.DMA_VDDM bit is set.	
0 – CIM has not been disabled;	
1 – CIM has been disabled	
Write 0 to this bit to clear.	

20.2.4 CIM Interrupt ID Register (CIMIID)

Bits	Name	Description	RW
31:0	FID	Interrupt frame ID. Contains a copy of the Frame ID register	R
		(CIMFID) from the descriptor currently being processed when a	
		DMA_SOF or DMA_EOF interrupt is generated. CIMIID is written to	
		only when CIMCMD.SOFINT or CIMCMD.EOFINT is high. As such,	
		the register is considered to be sticky and will be overwritten only	
		when the associated interrupt is cleared by writing the CIM state	
		register.	

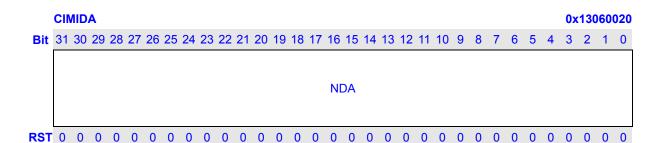

20.2.5 CIM RXFIFO Register (CIMRXFIFO)

Bits	Name	Description		
31:0	Data	This register provides a port for software to read image data directly.	R	
		When the software start CIM with DMA_EN=1, this register should not be		
		read. Otherwise, the DMA data may be damaged.		

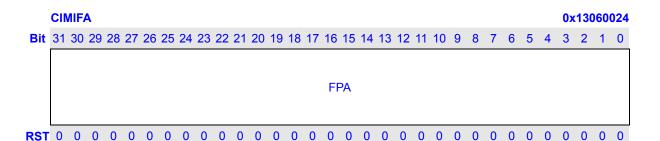

20.2.6 CIM Descriptor Address (CIMDA)

Bits	Name	Description			
31:0	NDA	Next descriptor physical address in external memory. DMAC gets the	RW		
		next descriptor according to it after finishing the current one. The target			
		address Bits [3:0] must be zero to be aligned to 16-byte boundary.			

20.2.7 CIM Frame buffer Address Register (CIMFA)

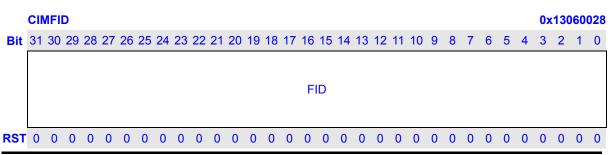

Bits	Name	Description			
31:0	FPA	Frame buffer physical address in external memory. When starts CIM,			
		DMA transfers data from RXFIFO to frame buffer. This address is			
		increased by hardware automatically. Bits [4:0] must be zero to be			
		aligned to 32-byte boundary.			

Note:

CIMFA comes from DMA Descriptor, so here it is read-only.

20.2.8 CIM Frame ID Register (CIMFID)

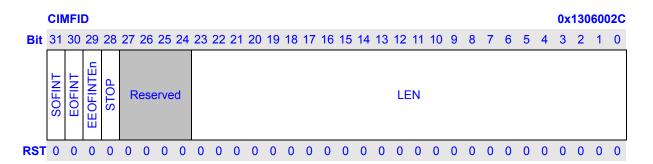

Bits	Name	Description			
31:0	FID	Frame ID. The particular use of this field is up to the software. This ID will			
		be copied to the CIMIID register when an interrupt occurs.			

Note:

CIMFID comes from DMA Descriptor, so here it is read-only.

20.2.9 CIM DMA Command Register (CIMCMD)

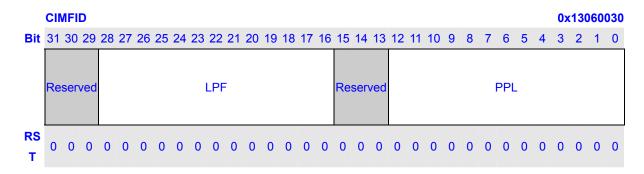

Bits	Name	Description	RW
31	SOFINTEn	Interrupt enable for DMA starting a frame-buffer transfer.	R
		1: DMA will set CIMSTATE.DMA_SOF when start of a frame-buffer	
		transfer.	
		When one frame uses several buffers, it is suggested to set	
		SOFINTEn of first buffer only.	
30	EOFINTEn	Interrupt enable for DMA ending a frame-buffer transfer.	R
		1: DMA will set CIMSTATE.DMA_EOF when CIMCMD.LEN is	
		decreased to 0, which means end of a frame-buffer transfer.	
		When one frame uses several buffers, it is suggested to set	
		EOFINTEn of last buffer only.	
29	EEOFINTEn	Interrupt enable for DMA issuing an earlier eof interrupt.	R
28	STOP	DMA stop. When DMA complete transferring data, STOP bit decides	R
		whether DMA should loading next descriptor or not.	
		0 – DMA start loading next descriptor;	
		1 – DMA stopped, and CIMSTATE.DMA_STOP bit is set 1 by	
		hardware	
27	OFRCVEN	Auto recovery enable when there is RXFIFO overflow	
		0 – No auto recovery when overflow occurs, thus the software should	
		do something;	
		1 – Auto recovery enable, the hardware will correct the overflow.	

26:24	Reserved		R
23:0	LEN	Length of transfer in words. Indicate the number of words to be	R
		transferred by DMA to a frame buffer. LEN = 0 is not valid. DMA	
		transfers data according to LEN. Each time one or more word(s)	
		been transferred, LEN is decreased automatically.	

20.2.10 CIM Window-image Size (CIMSIZE)

Bits	Name	Description	
31:29	Reserved		R
28:16	LPF	Lines per frame for CIM output.	
15:13	Reserved		R
12:0	PPL	Pixels per line for CIM output. PPL must be multiples of 2. In fact, the	RW
		number of CIM output data in word is equal to PPL/2.	

20.2.11 CIM Image Offset (CIMOFFSET)

Bits	Name	Description	RW
31:28	Reserved		R
27:16	V_OFFSET	Vertical offset.	RW
15:12	Reserved		R
11:0	H_OFFSET	Horizontal offset. It should be an even number.	RW

20.3 CIM Data Sampling Modes

CIM module supports several types of data sampling mode. The modes and the corresponding signals used are shown in the following diagram:

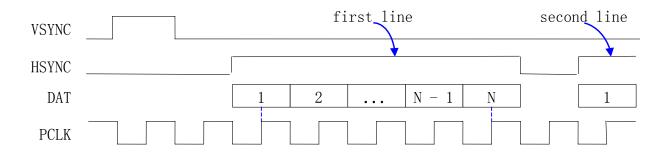

Mode \ Signals	CIM_VSYNC	CIM_HSYNC	CIM_PCLK	CIM_DATA
Gated Clock Mode	Y	Y	Y	Υ
ITU656 Interlace Mode	N	N	Y	Y
ITU656 Progressive Mode	N	N	Y	Υ

The modes and the corresponding signals used

20.3.1 Gated Clock Mode

CIM_VSYNC, CIM_HSYNC, and CIM_PCLK signals are used in this mode.

A frame starts with VSYNC leading edge, then HSYNC goes active and holds the entire line. Data is sampled at the valid edge of PCLK when HSYNC is active; That means, HSYNC functions like "data enable" signal. Please refer to the figure below.

Gated Clock Mode Input Timing Diagram

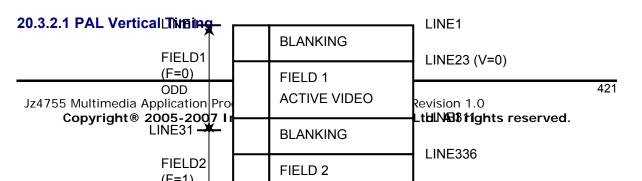

The VSYNC leading edge, HSYNC active HIGH or LOW, PCLK valid edges are programmable.

20.3.2 ITU656 Interlace Mode

In this mode, CIM_PCLK and CIM_DAT signals are used, CIM_VSYNC, CIM_HSYNC signals are ignored.

CIM utilizes the SAV & EAV code within ITU656data stream to get active video data.

The following diagrams and tables are quoted from ITU656standard. Only the PAL format is shown. CIM supports both NTSC and PAL formats. For more information about ITU656, please refer to ITU656 standard.

1	1	0	1	1	0	0
1	1	1	0	0	0	1

20.3.3 ITU656 Progressive Mode

CIM_PCLK and CIM_DAT signals are used in this mode. CIM_HSYNC signal is ignored.

CIM_VSYNC is optional in this mode. When the start of frame information is retrieved from SAV and EAV, it is known as internal VSYNC mode. When CIM_VSYNC is provided by sensor directly, it is known as external VSYNC mode. CIM supports both internal and external VSYNC modes.

ITU656Progressive Mode is a kind of Non-Interlace Mode. The image data are encoded within only one field. The F-bit of SAV and EAV are ignored. Most sensors support ITU656Progressive Mode.

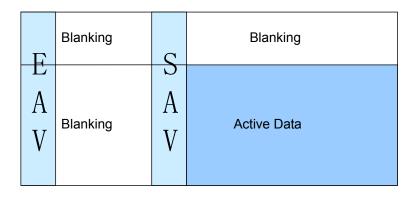

Figure 20-3 ITU656 Progressive Mode

20.4 DMA Descriptors

A DMA descriptor is a 4-word block corresponding to the four DMA registers – CIMDA, CIMFA, CIMFID, and CIMCMD, aligned on 4-word (16-byte) boundary, in external memory:

- word [0] contains the physical address for next CIMDA
- word [1] contains the physical address for CIMFA
- word [2] contains the value for CIMFID
- word [3] contains the value for CIMCMD

Software must write the physical address of the first descriptor to CIMDA before enabling the CIM. Once the CIM is enabled, the first descriptor is read, and all 4 registers are written by the DMAC. The next DMA descriptor pointed to by CIMDA is loaded into the registers after all data for the current descriptor has been transferred.

Note: If only one frame buffer is used in external memory, the CIMDA field (word [0] of the DMA descriptor) must point back to itself. That is to say, the value of CIMDA is the physical address of itself.

20.5 Interrupt Generation

CIM has next interrupt sources:

Step 1. RXFIFO FULL Interrupt (RF_TRIG)

When the valid data number of RXFIFO reaches trigger value, CIMST.RF_TRIG bit is set. At the same time, if RF_TRIGM is 1, RF_TRIG interrupt is generated.

Step 2. RXFIFO Over Flow Interrupt (RF_OF)

When the valid data number of RXFIFO reaches 32 and one more data are written to RXFIFO, CIMST.RF_OF bit is set. At the same time, if RF_OFM is 1, RF_OF interrupt is generated.

Step 3. DMA Start Of Frame Data Transferring Interrupt (DMA_SOF)

When the CIMCMD.SOFINT bit is 1 and DMA start transferring the first data from RXFIFO to frame buffer, CIMST.DMA_SOF bit is set. At the same time, if DMA_SOFM is 1, DMA_SOF interrupt is generated.

Step 4. DMA End Of Frame Data Transferring Interrupt (DMA EOF)

When the CIMCMD.EOFINT bit is 1 and DMA complete transferring the last data from RXFIFO to frame buffer, CIMST.DMA_EOF bit is set. At the same time, if DMA_EOFM is 1, DMA_EOF interrupt is generated.

Step 5. DMA Stop Transferring Interrupt (DMA STOP)

When the CIMCMD.STOP bit is 1 and DMA complete transferring the last data from RXFIFO to frame buffer, CIMST.DMA_STOP bit is set. At the same time, if DMA_STOPM is 1, DMA_STOP interrupt is generated.

Step 6. CIM Disable Done Interrupt (VDD)

When disable the module by clearing the CIMCR.ENA, the module should be disabled after transferring current valid data. Then set the CIMST.VDD bit, at the same time, if VDDM is set, VDD interrupt is generated.

20.6 Software Operation

20.6.1 Enable CIM with DMA

- Step 1. Configure register CIMCFG;
- Step 2. Prepare frame buffer and descriptors;
- Step 3. Configure register CIMDA;
- Step 4. Clear state register: write 0 to register CIMSTATE;
- Step 5. Reset RXFIFO: configure register CIMCTRL with DMA_EN=1, RXF_RST=1, ENA=0;
- Step 6. Stop resetting RXFIFO: configure register CIMCTRL with DMA_EN=1, RXF_RST=0, ENA=0;
- Step 7. Enable CIM: configure register CIMCTRL with DMA_EN=1, RXF_RST=0, ENA=1.

20.6.2 Enable CIM without DMA

- 1. Configure register CIMCFG;
- 2. Clear state register: write 0 to register CIMSTATE;
- 3. Reset RXFIFO: configure register CIMCTRL with DMA EN=1, RXF RST=1, ENA=0;
- 4. Stop resetting RXFIFO: configure register CIMCTRL with DMA_EN=1, RXF_RST=0, ENA=0;
- 5. Enable CIM: configure register CIMCTRL with DMA_EN=1, RXF_RST=0, ENA=1.

20.6.3 Disable CIM

Method 1:

- Step 1. Configure register CIMCTRL with RXF_RST=0, ENA=0; // quick disable
- Step 2. Clear state register: write 0 to register CIMSTATE.

Method 2:

When DMA is enabled, the following sequence is recommended:

- Step 1. Configure descriptor with STOP = 1;
- Step 2. Wait DMA_STOP interrupt, then write 0 to CIMCTRL.ENA;
- Step 3. Clear state register: write 0 to register CIMSTATE.

21 MMC/SD CE-ATA Controller

21.1 Overview

The MultiMediaCard (MMC) is a universal low cost data storage and communication media that is designed to cover a wide area of applications such as electronic toys, organizers, PDAs, smart phones, and so on.

The Secure Digital (SD) card is an evolution of MMC, It is specifically designed to meet the security, capacity, performance, and environmental requirements inherent in newly emerging audio and video consumer electronic devices. The physical form factor, pin assignment, and data transfer protocol are forward compatible with the MultiMediaCard with some additions. An SD card can be categorized as SD memory or SD I/O card, commonly known as SDIO. A memory card invokes a copyright protection mechanism that complies with the security of the SDMI standard and is faster and capable of higher memory capacity. The SDIO card provides high-speed data I/O with low-power consumption for mobile electronic devices.

For CE-ATA detail protocol, please referred to <u>WWW.CE-ATA.ORG</u>

Features of the MSC Controller include the following:

- Fully compatible with the MMC System Specification version 4.2
- Fully compatible with the SD Memory Card Specification 2.0 and SD I/O Specification 1.0 with 1 command channel and 4 data channels
- Consumer Electronics Advanced Transport Architecture (CE-ATA version 1.1)
- 20-80 Mbps maximum data rate
- Support MMC data width 1bit ,4bit and 8bit
- Built-in programmable frequency divider for MMC/SD bus
- Maskable hardware interrupt for SDIO interrupt, internal status and FIFO status
- 32-entry x 32-bit built-in data FIFO
- Multi-SD function support including multiple I/O and combined I/O and memory
- IRQ supported enable card to interrupt MMC/SD controller
- Single or multi block access to the card including erase operation
- Stream access to the MMC card
- Supports SDIO read wait, interrupt detection during 1-bit or 4-bit access
- Supports CE-ATA digital protocol commands
- Support Command Completion Signal and interrupt to CPU
- Command Completion Signal disable feature
- The maximum block length is 4096bytes

21.2 Block Diagram

MSC Controller Block Diagram

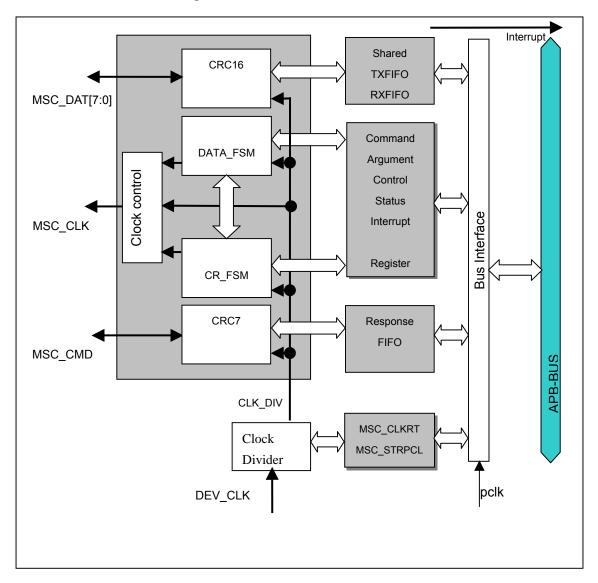

Figure 21-1 MMC/SD CE-ATA Controller Block Diagram

21.3 MMC/SD Controller Signal I/O Description

MSC and the card communication over the CMD and DATA line is base on command and data bit streams which are initiated by a start bit and terminated by a stop bit.

Command: a command is a token, which starts an operation. A command is sent from MSC either to a single card (addressed command) or to all connected cards (broadcast command). A command is transferred serially on the CMD line. Each command token is preceded by a start bit ('0') and succeeded by an end bit ('1'). The total length is 48 bits and protected by CRC bits.

Bit 47 46 [45:40] [39:8] [7:1] 0 position Width (bits) 1 1 6 32 7 1 0 Χ Χ 1 Value Х Description Start Transmission Command argument CRC7 End bit bit bit index

Table 21-1 Command Token Format

- Response: a response is a token which is sent from an addressed card, or (synchronously) from all connected cards, to MSC as an answer to a previously received command. A response is transferred serially on the CMD line. Response tokens have varies coding schemes depending on their content.
- Data: data can be transferred from the card to MSC or vice versa. Data is transferred via the data line. Data transfers to/from the SD Memory Card are done in blocks. Data blocks always succeeded by CRC bits. Single and multiple block operations are defined. Note that the Multiple Block operation mode is better for faster write operation. A multiple block transmission is terminated when a stop command follows on the CMD line. Data transfer can be configured by the MSC to use single or multiple data lines.

Table 21-2 MMC/SD Data Token Format

Description	Start bit	Data	CRC16	End bit
Stream Data	0	X	no CRC	1
Block Data	0	Х	Х	1

21.4 Register Description

The MMC-SD-CE_ATA controller is controlled by a set of registers that the application configures before every operation. The Table 21-3 lists all the MSC registers.

Table 21-3 MMC/SD Controller Registers Description

Name	RW	Reset Value	Address	Access Size

21.4.1 MMC/SD Control Register (MSC_CTRL)

	MSC_CTRL0 MSC_CTRL1															210 220	
Bit			15	14	13	12	11	10 9	8	7	6	5	4	3	2	1	0
		Reserved	SEND_CCSD	SEND_AD_CCSD		R	eser	ved		EXIT_MULTIPLE	EXIT_TRANSFER	START_READWAIT	STOP_READWAIT	RESET	START_OP	STRPC	
RST			0	0	0	0	0	0 0	0	0	0	0	0	0	0	0	0

Bits	Name	Description	RW
15	SEND_CCSD	0 – clear bit	W
		1 – Send Command Completion Signal Disable (CCSD) to	
		CE_ATA device	
		when set, host sends CCSD to CE_ATA device. Software set the	
		bit only if current command is expecting CCS and interrupts are	
		enabled in CE_ATA devices. Once the CCSD pattern is sent to	
		device, host automatically clears the SEND_CCSD bit.	
14	SEND_AS_CCSD	0 – clear bit .	W
		1 – send internally generated stop after sending CCSD to	
		CE_ATA device.	
		When set, host automatically sends internally-generated STOP	
		command(CMD12) to CE_ATA device. After sending CMD12,	
		Auto Command Done (ACD) is set and generates interrupt to	
		CPU. After sending the CCSD, controller automatically clears the	
		SEND_AS_CCSD bit.	
13:8	Reserved		R
7	EXIT_MULTIPLE	If CMD12 or CMD52 (I/O abort) is to be sent to terminate multiple	W
		block read/write in advance, set this bit to 1.	
		0 – No effect.	
		1 – Exit from multiple block read/write.	
6	EXIT_TRANSFER	Only used for SDIO suspend/resume and MMC stream read.	W
		For SDIO, after suspend is accepted, set this bit with 1.	
		For MMC, after the expected number of data are received, set this	
		bit with 1.	
		0 – No effect.	
		1 – Exit from multiple block read/write after suspend is accepted,	
		or exit from stream read.	
5	START_READWAIT	Only used for SDIO ReadWait. Start the ReadWait cycle.	W

		0 – No effect.	
		1 – Start ReadWait.	
4	STOP_READWAIT	Only used for SDIO ReadWait. Stop the ReadWait cycle.	W
		0 – No effect.	
		1 – Start ReadWait.	
3	RESET	Resets the MMC/SD controller.	W
		0 – No effect.	
		0 – Reset the MMC/SD controller.	
2	START_OP	This bit is used to start the new operation. When starting the	W
		clock, this bit can be 1. When stopping the clock, this bit can only	
		be 0.	
		0 – Do nothing.	
		1 – Start the new operation.	
1:0	CLOCK_CONTROL	These bits are used to start or stop clock.	W
		00 – Do nothing.	
		01 – Stop MMC/SD clock	
		10 – Start MMC/SD clock	
		11 – Reserved	

21.4.2 MSC Status Register (MSC_STAT)

				AT(210 220	
Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

RST	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	0	0	0	0	0	0

Bits	Name	Description	RW
31	AUTO_CMD_DONE	Indicate that the stop command (CMD12) that is internally	R
		generated by controller has finished.	
30:16	Reserved		R
15	IS_RESETTING	MSC is resetting after power up or MSC_STRPCL[RESET]	R
		is written with 1	
		0 – Reset has been finished.	
		1 – Reset has not been finished.	

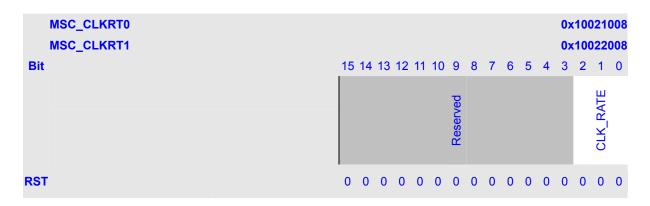

14	SDIO INT ACTIVE	Indicates whether an interrupt is detected at the SD I/O	R
		card. A separate acknowledge command to the card is	
		required to clear this interrupt.	
		0 – No interrupt detected.	
		1 – The interrupt from SDIO is detected.	
13	PRG_DONE	Indicates whether card has finished programming.	R
		0 – Card has not finished programming and is busy.	
		1 – Card has finished programming and is not busy.	
12	DATA_TRAN_DONE	Indicates whether data transmission to card has	R
		completed.	
		0 – Data transmission to card has not completed.	
		1 – Data transmission to card has completed.	
11	END_CMD_RES	End command-response sequence or command	R
• •		sequence.	``
		0 – Command and response/no-response sequence has	
		not completed.	
		1 – Command and response/no-response sequence has	
		completed.	
10	DATA_FIFO_AFULL	Indicates whether data FIFO is almost full (The number of	R
. 0	<i>571171 6_71 622</i>	words >= 15). For reading data from card, use this bit.	'`
		0 – Data FIFO is not full.	
		1 – Data FIFO is full.	
9	IS_READWAIT	Indicates whether SDIO card has entered ReadWait State	R
		0 – Card has not enter ReadWait.	``
		1 – Card has enter ReadWait.	
8	CLK_EN	Clock enabled.	R
	_	0 – Clock is off.	
		1 – Clock is on.	
7	DATA_FIFO_FULL	Indicates whether data FIFO is full. For reading data from	R
		card, do not use this bit, because it almost keeps to be 0.	
		0 – Data FIFO is not full.	
		1– Data FIFO is full.	
6	DATA_FIFO_EMPTY	Indicates whether data FIFO is empty.	R
		0 – Data FIFO is not empty.	
		1– Data FIFO is empty.	
5	CRC_RES_ERR	Response CRC error.	R
		0 – No error on the response CRC.	
		1– CRC error occurred on the response.	
4	CRC_READ_ERROR	CRC read error.	R
		0 – No error on received data.	
		1– CRC error occurred on received data	
3:2	CRC_WRITE_ERROR	CRC write error.	R
•	=	00 – No error on transmission of data.	
	1	The state of the s	

		01 – Card observed erroneous transmission of data.	
		10 – No CRC status is sent back.	
		11 – Reserved	
1	TIME_OUT_RES	Response time out.	R
		0 – Card response has not timed out.	
		1 – Card response has time out.	
0	TIME_OUT_READ	Read time out.	R
		0 – Card read data has not timed out.	
		1 – Card read data has timed out.	

21.4.3 MSC Clock Rate Register (MSC_CLKRT)

The MSC_CLKRT register specifies the frequency division of the MMC/SD bus clock. The software is responsible for setting this register.

Bits	Name	Description	RW
15:3	Reserved		R
2:0	CLK_RATE	Clock rate.	WR
		000 - CLK_SRC.	
		001 – 1/2 of CLK_SRC.	
		010 – 1/4 of CLK_SRC.	
		011 – 1/8 of CLK_SRC.	
		100 – 1/16 of CLK_SRC.	
		101 – 1/32 of CLK_SRC.	
		110 – 1/64 of CLK_SRC.	
		111 – 1/128 of CLK_SRC.	

21.4.4 MMC/SD Command and Data Control Register (MSC_CMDAT)

 MSC_CMDAT0
 0x1002100C

 MSC_CMDAT1
 0x1002200C

 Bit
 31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0

|--|

Bits	Name	Description					
31	CCS_EXPECTED	0 – interrupts are not enabled in CE-ATA device, or	RW				
		commands does not expect CCS from device					
		1 – interrupts are enabled in CE_ATA device, or RW_BLK					
		command expects command completion signal from					
		device.					
		If the command expects Command Completion Signal					
		(CCS) from the device, the software should set the control					
		bit. It is auto cleared 0 by hardware.					
30	READ_CEATA	0 – host is not performing read access (RW_BLK or	RW				
		RW_REG) towards CE_ATA device					
		1 – host id performing read access (RW_BLK or					
		RW_REG) towards CE_ATA device					
		Software should set the bit to indicate that CE_ATA device					
		is being accessed for read transfer. The bit is used to					
		disable read data timeout indication while performing					
		CE_ATA read transfers. It is auto cleared 0 by hardware.					
29:18	Reserved		R				
17	SDIO_PRDT	Determine whether SDIO interrupt is 2 cycle or extend	RW				
		more cycle when data block last is transferred					
		0 – more cycle (like single block)					
		1 – exact 2 cycle					
16	SEND_AS_STOP	0 – no stop command sent at end of data transfer	RW				
		1 – send stop command at end of data transfer					
		when stop command has finished, it is auto cleared 0 by					
		hardware.					
15:14	RTRG	These bits set the receive FIFO half-empty threshold	RW				
		value, when the number of transmit FIFO >= threshold					
		value , RXFIFO_RD_REQ will be set to 1					
		00 : more than or equal to 8					
		01: more than or equal to 16					
		10: more than or equal to 24					
		11: reserved					
13:12	TTRG	These bits set the transmit FIFO half-empty threshold	RW				

		1
	value, when the number of transmit FIFO < threshold	
	value , TXFIFO_WR_REQ will be set to 1	
	00 : less than 8	
	01: less than 16	
	10: less than 24	
	11: reserved	
TOP_ABORT	Specifies the current command is used to abort data	WR
	transfer	
	0 – Nothing.	
	1 – The current command is used to abort transfer.	
	it is auto cleared 0 by hardware.	
JS_WIDTH	Specifies the width of the data bus.	WR
	00 – 1-bit.	
	01 – Reserved.	
	10 – 4-bit.	
	11 – 8bit.	
MA_EN	DMA mode enables. When DMA mode is used, this bit is	WR
	also a mask on RXFIFO_RD_REQ and	
	TXFIFO_WR_REQ interrupts.	
	0 – Program I/O.	
	1 – DMA mode.	
IT	80 initialization clocks	W
	0 – Do not precede command sequence with 80 clocks.	
	1 – Precede command sequence with 80 clocks.	
JSY	Specifies whether a busy signal is expected after the	WR
	current command. This bit is for no data	
	command/response transactions only.	
	0 – Not expect a busy signal.	
	0 – Expects a busy signal. If the response is R1b, then set	
	it.	
FREAM_BLOCK	Stream mode	WR
_	0 – Data transfer of the current command sequence is not	
	in stream mode.	
	1– Data transfer of the current command sequence is in	
	stream mode.	
RITE_READ	Specifies that the data transfer of the current command is	WR
_		
	·	
	is a read operation.	
	•	
	is a write operation.	
	io a witto oporation.	1
ATA_EN	Specifies whether the current command includes a data	WR
	JS_WIDTH MA_EN TREAM_BLOCK	value , TXFIFO_WR_REQ will be set to 1 00 : less than 8 01: less than 16 10: less than 24 11: reserved TOP_ABORT Specifies the current command is used to abort data transfer 0 - Nothing. 1 - The current command is used to abort transfer. it is auto cleared 0 by hardware. JS_WIDTH Specifies the width of the data bus. 00 - 1-bit. 01 - Reserved. 10 - 4-bit. 11 - 8bit. MA_EN DMA mode enables. When DMA mode is used, this bit is also a mask on RXFIFO_RD_REQ and TXFIFO_WR_REQ interrupts. 0 - Program I/O. 1 - DMA mode. IT 80 initialization clocks 0 - Do not precede command sequence with 80 clocks. 1 - Precede command sequence with 80 clocks. 1 - Precede command sequence with 80 clocks. 2 Specifies whether a busy signal is expected after the current command/response transactions only. 0 - Not expect a busy signal. 0 - Expects a busy signal. If the response is R1b, then set it. ITREAM_BLOCK Stream mode 0 - Data transfer of the current command sequence is not in stream mode. 1 - Data transfer of the current command sequence is in stream mode. 1 - Data transfer of the current command sequence is in stream mode. 1 - Data transfer of the current command sequence is not in stream mode. 2 - Specifies that the data transfer of the current command is a read or write operation. 0 - Specifies that the data transfer of the current command is a read operation. 1 - Specifies that the data transfer of the current command

		0 – No data transfer with current command.	
		1 – Has data transfer with current command. It is also used	
		to reset RX_FIFO and TX_FIFO.	
2:0	RESPONSE_FORMAT	These bit specify the response format for the current	WR
		command.	
		000 – No response.	
		001 – Format R1 and R1b.	
		010 – Format R2.	
		011 – Format R3.	
		100 – Format R4.	
		101 – Format R5.	
		110 – Format R6.	
		111 – Format R7.	

21.4.5 MMC/SD Response Time Out Register (MSC_RESTO)

Bits	Name	Description	RW
15:8	Reserved		R
7:0	RES_TO	Specifies the number of MSC_CLK clock counts between the command	WR
		and when the MMC/SD controller turns on the time-out error for the	
		received response. The default value is 64.	

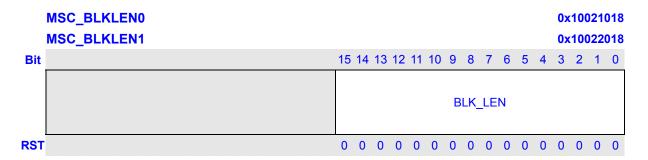

21.4.6 MMC/SD Read Time Out Register (MSC_RDTO)

Bi	its	Name	Description	RW
31:	:0	READ_TO	Specifies the number of clocks between the command and when the	WR
			MMC/SD host controller turns on the time-out error for the received	

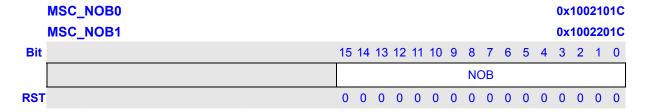

|--|

21.4.7 MMC/SD Block Length Register (MSC_BLKLEN)

Bits	Name	Description	RW
15:0	BLK_LEN	Specifies the number of bytes in a block, and is normally set to 0x200	WR
		for MMC/SD data transactions. The value Specified in the cards	
		CSD.	

21.4.8 MSC/SD Number of Block Register (MSC_NOB)

Bits	Name	Description	RW
15:0	NOB	Specifies the number of blocks in a data transfer. One block is a	WR
		possibility.	

21.4.9 MMC/SD Number of Successfully-transferred Blocks Register (MSC_SNOB)

In block mode, the MSC_SNOB register records the number of successfully transferred blocks. If the last block has CRC error, this register also summaries it. It is used to query blocks for multiple block transfer.

	MSC_SNOB0 MSC_SNOB1														100 100		
Bit		15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
								MS	C_	SN	ОВ						
RST		?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?

Bits	Name	Description	RW	
				1

15:0	MSC_SNOB	Specify the number of successfully transferred blocks for a multiple	R
		block transfer.	

21.4.10 MMC/SD Interrupt Mask Register (MSC_IMASK)

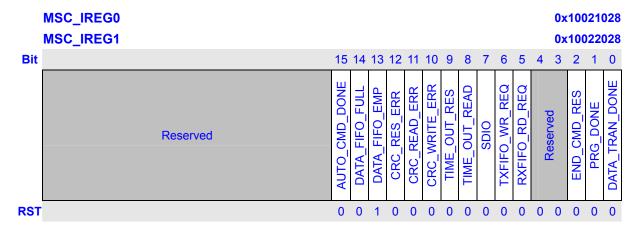

Bits	Name	Description	RW
31:16	Reserved		R
15	AUTO_CMD_DONE	Mask the interrupt Auto Cmd Done (ACD)	RW
		0 – Not masked	
		1 - Masked	
14	DATA_FIFO_FULL	0 – Not masked	RW
		1 - Masked	
13	DATA_FIFO_EMP	0 – Not masked	RW
		1 - Masked	
12	CRC_RES_ERR	0 – Not masked	RW

8	TIME_OUT_READ	0 – Not masked	RW
		1 - Masked	
7	SDIO	Mask the interrupt from the SD I/O card.	WR
		0 – Not masked.	
		1 – Masked.	
6	TXFIFO_WR_REQ	Mask the Transmit FIFO write request interrupt.	WR
		0 – Not masked.	
		1 – Masked.	
5	RXFIFO_RD_REQ	Mask the Receive FIFO read request interrupt.	WR

		0 – Not masked.	
		1 – Masked.	
4:3	Reserved		R
2	END_CMD_RES	Mask the End command response interrupt.	WR
		0 – Not masked.	
		1 – Masked.	
1	PRG_DONE	Mask the Programming done interrupt.	WR
		0 – Not masked.	
		1 – Masked.	
0	DATA_TRAN_DONE	Mask the Data transfer done interrupt.	WR
		0 – Not masked.	
		1 – Masked.	

21.4.11 MMC/SD Interrupt Register (MSC_IREG)

The MSC_IREG register shows the currently requested interrupt. The FIFO request interrupts, TXFIFO_WR_REQ, and RXFIFO_RD_REQ are masked off with the DMA_EN bit in the MSC_CMDAT register. The software is responsible for monitoring these bit in program I/O mode.

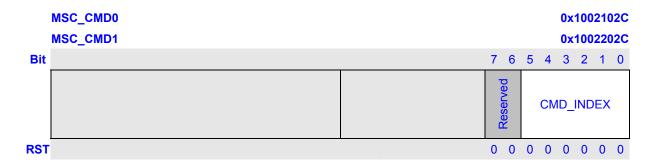

Bits	Name	Description	RW
15	AUTO_CMD_DONE	indicate Auto Cmd Done (ACD) interrupt	RW
		0 – the interrupt is not detected	
		1 – the interrupt is detected	
14	DATA_FIFO_FULL	Indicate data FIFO is full interrupt	R
		0 – the interrupt is not detected	
		1 – the interrupt is detected	
13	DATA_FIFO_EMP	Indicate data FIFO is empty interrupt	R
		0 – the interrupt is not detected	
		1 – the interrupt is detected	
12	CRC_RES_ERR	Indicate response CRC error interrupt	RW
		0 – the interrupt is not detected	
		1 – the interrupt is detected	

11	CRC_READ_ERR	Indicate CRC read error interrupt	RW
		0 – the interrupt is not detected	
		1 – the interrupt is detected	
10	CRC_WRITE_ERR	Indicate CRC write error interrupt	RW
		0 – the interrupt is not detected	
		1 – the interrupt is detected	
9	TIME_OUT_RES	Indicate response time out interrupt	RW
		0 – the interrupt is not detected	
		1 – the interrupt is detected	
8	TIME_OUT_READ	Indicate read time out interrupt	RW
		0 – the interrupt is not detected	
		1 – the interrupt is detected	
7	SDIO	Indicates whether the interrupt from SDIO is detected.	R
		0 – The interrupt from SDIO is not detected.	
		1 – The interrupt from SDIO is detected.	
6	TXFIFO_WR_REQ	Transmit FIFO write request. Set if data FIFO becomes half	R
		empty (the number of words is < 8).	
		0 – No Request for data Write to MSC_TXFIFO.	
		1 – Request for data write to MSC_TXFIFO.	
5	RXFIFO_RD_REQ	Receive FIFO read request. Set if data FIFO becomes half	R
		full (the number of words is >= 8) or the entries in data FIFO	
		are the last read data.	
		0 – No Request for data read from MSC_RXFIFO.	
		1 – Request for data read from MSC_RXFIFO.	
4:3	Reserved		R
2	END_CMD_RES	Indicates whether the command/response sequence has	WR
_	LIVE_GIVID_IVEG	been finished.	***
		0 – The command/response sequence has not been	
		finished.	
		1 – The command/response sequence has bee finished.	
		Write 1 to clear.	
1	PRG_DONE	Indicates whether card has finished programming.	WR
'	TINO_BOINE	0 – Card has not finished programming and is busy.	771
		Card has finished programming and is no longer busy. 1 – Card has finished programming and is no longer busy.	
		Write 1 to clear.	
0	DATA TRAN DONE	Indicates whether data transfer is done. Note that for stream	WR
O	DATA_TIVAN_DONE	read/write, only when CMD12 (STOP_TRANS) has been	VVIX
		sent, is this bit set.	
		0 – Data transfer is not complete.	
		1 – Data transfer has completed or an error has occurred.	
		Write 1 to clear.	

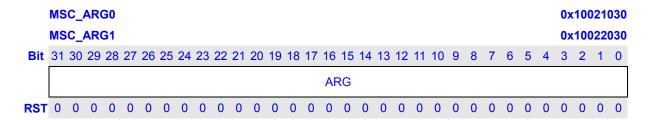

21.4.12 MMC/SD Command Index Register (MSC_CMD)

Bits	Name	Description					
7:6	Reserved		R				
5:0	CMD_INDEX	Specifies the command index to be executed.	WR				

21.4.13 MMC/SD Command Argument Register (MSC_ARG)

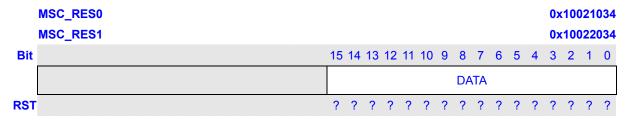

Bits	Name	Description	RW
31:0	ARG	Specifies the argument for the current command.	WR

21.4.14 MMC/SD Response FIFO Register (MSC_RES)

The read-only MMC/SD Response FIFO register (RES_FIFO) holds the response sent back to the MMC/SD controller after every command. The size of this FIFO is 8 x 16-bit. The RES FIFO does not contain the 7-bit CRC for the response. The Status for CRC checking and response time-out status is in the status register, MSC_STAT.

The first halt-word read from the response FIFO is the most significant halt-word of the received response.

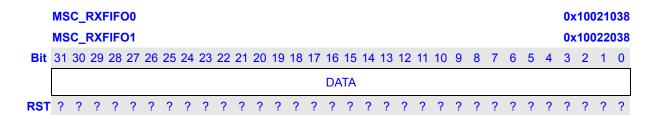

Bits	Name	Description	RW	
------	------	-------------	----	--

15:0	DATA	Contains the response to every command that is sent by the MMC/SD	R
		controller. The size of this FIFO register is 8 x 16-bit.	

21.4.15 MMC/SD Receive Data FIFO Register (MSC_RXFIFO)

The MSC_RXFIFO is used to read the data from a card. It is read-only to the software, and is read on 32-bit boundary. The size of this FIFO is 16 x 32-bit.

Bits	Name	Description	RW
31:0	DATA	One word of read data. The size of this FIFO is 16 x 32-bit.	R

21.4.16 MMC/SD Transmit Data FIFO Register (MSC_TXFIFO)

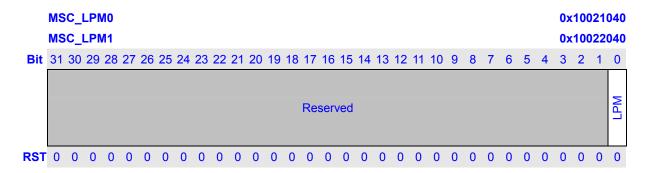

The MSC_TXFIFO is used to write the data to a card. It is write-only to the software, and is written on 32-bit boundary. The size of this FIFO is 16 x 32-bit.

	MS	C	ГХБ	IFC	00																								0x	100	210	3C

Bits	Name	Description	RW
31:0	DATA	One word of write data. The size of this FIFO is 16 x 32-bit.	W

21.4.17 MMC/SD Low Power Mode Register (MSC_LPM)

The MSC_LPM is used to control whether MSC controller enters Low-Power Mode.

Bits	Name	Description	RW
31:1	Reserved		R
0	LPM	0 : Non –Low Power Mode	RW
		1: Low-Power Mode. Stop clock when card in idle (should be normally set	
		to only MMC and SD cards. For SDIO cards, if interrupts must be	
		detected, clock should not be stopped)	
		When software sets the bit, MSC clock can auto be stopped	
		Note: when set the bit, the start_clock and stop clock can be not use.	

21.5 MMC/SD Functional Description

All communication between system and cards is controlled by the MSC. The MSC sends commands of two type: broadcast and addressed (point-to-point) commands.

Broadcast commands are intended for all cards, command like "Go_Idle_State", "Send_Op_Cond", "All_send_CID" and "Set_relative_Addr" are using way of broadcasting. During Broadcast mode, all cards are in open-drain mode, to avoid bus contention.

After Broadcast commands "Set_relative_Addr" issue, cards are enter standby mode, and Addressed command will be used from now on, in this mode, CMD/DAT will return to push-pull mode, to have maximum driving for maximum operation frequency.

The MMC and the SD are similar product. Besides the 4x bandwidth and the built-in encryption, they are being programmed similarly.

The MMC/SD controller (MSC) is the interface between the software and the MMC/SD bus. It is responsible for the timing and protocol between the software and the MMC/SD bus. It consists of control and status registers, a 16-bit response FIFO that is 8 entries deep, and one 32-bit receive/transmit data FIFOs that are 16 entries deep. The registers and FIFOs are accessible by the software.

MSC also enable minimal data latency by buffering data and generating and checking CRCs.

21.5.1 MSC Reset

The MMC/SD controller (MSC) can be reset by a hardware reset or software reset. All registers and FIFO controls are set to their default values after any reset.

21.5.2 MSC Card Reset

The command Go_Idle_State, CMD0 is the software reset command for MMC and SD Memory Card, and sets each card into Idle State regardless of the current card state; while in SDIO card, CMD52 is used to write IO reset in CCCR. The cards are initialized with a default relative card address (RCA=0x0000) and with a default driver stage register setting (lowest speed, highest driving current capability).

21.5.3 Voltage Validation

All cards shall be able to establish communication with the host using any operation voltage in the maximal allowed voltage range specified in this standard. However, the support minimum and maximum values for Vdd are defined in Operation Conditions register (OCR) and many not cover the whole range. Cards that store the CID and CSD data in the payload memory would be able to communicate these information only under data transfer Vdd conditions. That means if host and card have non compatible Vdd ranges, the card will not be able to complete the identification cycle, nor to send CSD data.

Therefore, a special command Send_Op_cont (CMD1 for MMC), SD_Send_Op_Cont (CMD41 for SD Memory) and IO_Send_Op_Cont (CMD5 for SDIO) are designed to provide a mechanism to identify and reject cards which do not match the Vdd range desired by the host. This is accomplished by the host sending the required Vdd voltage window as the operand of this command. Cards which can not perform data transfer in the specified range must discard themselves from further bus operations and go into Inactive State. By omitting the voltage range in the command, the host can query each card and determine the common voltage range before sending out-of-range cards into the Inactive State. This query should be used if the host is able to select a common voltage range or if a notification to the application of non usable cards in the stack is desired.

21.5.4 Card Registry

Card registry on MCC and SD card are different.

For SD card, Identification process start at clock rate Fod, while CMD line output drives are push-pull drivers instead of open-drain. After the bus is activated the host will request the cards to send their valid operation conditions. The response to ACMD41 is the operation condition register of the card. The same command shall be send to all of the new cards in the system. Incompatible cards are sent into Inactive State. The host then issue the command All_Send_CID (CMD2) to each card and get its unique card indentification (CID) number. Card that is unidentified, that is, which is in Ready State, send its CID number as the response. After the CID was sent by the card it goes into Identification State. Thereafter, the host issues Send_Relative_Addr (CMD3) asks the card to publish a new relative card address (RCA), which is shorter that CID and which will be used to address the card in the future data transfer mode. Once the RCA is received the card state changes to the Stand-by State. At this point, if the host wants that the card will have another RCA number, it may ask the card to publish a new number by sending another Send_Relative_Addr command to the card. The last published RCA is the actual RCA of the card. The host repeats the identification process, that is, the cycles with CMD2 and CMD3 for each card in the system.

In MMC, the host starts the card identification process in open-drain mode with the identification clock rate Fod. The open drain driver stages on the CMD line allow parallel card operation during card identification. After the bus is actived the host will request the cards to send their valid operation conditions (CMD1). The response to CMD1 is the 'wired or' operation on the condition restrictions of all cards in the system. Incompatible cards are sent into Inactive State. The host then issues the broadcast command All_Send_CID (CMD2), asking all cards for their unique card

identification (CID) number. All unidentified cards, that is, those which are in Ready State, simultaneously start sending their CID numbers serially, while bit-wise monitoring their outgoing bitstream. Those cards, whose outgoing CID bits do not match the corresponding bits on the command line in any one of the bit periods stop sending their CID immediately and must wait for the next identification cycle. Since CID is unique for each card, only one card can be successfully send its full CID to the host. This card then goes into Identification State. Thereafter, the host issues Set_Relative_Addr (CMD3) to assign to this card a relative card address (RCA). Once the RCA is received the card state changes to the Stand-by State, and the card does not react to further identification cycles, and its output switches from open-drain to push-pull. The host repeat the process, that is CM2 and CMD3, until the host receive time-out condition to recognize completion of the identification process.

21.5.5 Card Access

21.5.5.1 Block Access, Block Write and Block Read

During block write (CMD24-27) one or more blocks of data are transferred from the host to the card with a CRC appended to the end of each block by the host. A card supporting block write shall always be able to accept a block of data defined by WRITE_BL_LEN. If the CRC fails, the card shall indicate the failure on the DAT line; the transferred data will be discarded and not written, and all further transmitted blocks (in multiple block write mode) will be ignored.

Programming of the CID and CSD registers does not require a previous block length setting. The transferred data is also CRC protected. If a part of the CSD or CID register is stored in ROM, then this unchangeable part must match the corresponding part of the receive buffer. If this match fails, then the card will report an error and not change any register contents. Some cards may require long and unpredictable times to write a block of data. After receiving a block of data and completing the CRC check, the card will begin writing and hold the DAT line low if its write buffer is full and unable to accept new data from a new WRITE_BLOCK command. The host may poll the status of the card with a SEND_STATUS command (CMD13) at any time, and the card will respond with its status. The status bit READY_FOR_DATA indicates whether the card can accept new data or whether the write process is still in progress). The host may deselect the card by issuing CMD7 (to select a different card) which will displace the card into the Disconnect State and release the DAT line without interrupting the write operation. When reselecting the card, it will reactivate busy indication by pulling DAT to low if programming is still in progress and the writte buffer is unavailable.

Block read is similar to stream read, except the basic unit of data transfer is a block whose maximizes is defined in the CSD (READ_BL_LEN). If READ_BL_PARTIAL is set, smaller blocks whose starting and ending address are entirely contained within one physical block (as defined by READ_BL_LEN) may also be transmitted. Unlike stream read, a CRC is appended to the end of each block ensuring data transfer integrity. CMD17 (READ_SINGLE_BLOCK) initiates a block read and after completing the transfer, the card returns to the Transfer state. CMD18 (READ_MULTIPLE_BLOCK) starts a transfer of several consecutive blocks. Blocks will be continuously transferred until a stop command is issued. If the host uses partial blocks whose

accumulated length is not block aligned and block misalignment is not allowed, the card shall detect a block misalignment at the beginning of the first mis-aligned block, set the ADDRESS_ERROR error bit in the status register, abort transmission and wait in the Data State for a stop command.

21.5.5.2 Stream Access, Stream Write and Stream Read (MMC Only)

Stream write (CMD20) starts the data transfer from the host to the card beginning from the starting address until the host issues a stop command. Since the amount of data to be transferred is not determined in advance, CRC can not be used. If the end of the memory range is reached while sending data and no stop command has been sent by the host, all further transferred data is discarded.

There is a stream oriented data transfer controlled by READ_DAT_UNTIL_STOP (CMD11). This command instructs the card to send its payload, starting at a specified address, until the host sends a STOP_TRANSMISSION command (CMD12). The stop command has execution delay due to the serial command transmission. The data transfer stops after the end bit of the stop command. If the end of the memory range is reached while sending data and no stop command has been sent yet by the host, the contents of the further transferred payload is undefined.

21.5.5.3 Erase, Group Erase and Sector Erase (MMC Only)

It is desirable to erase many sectors simultaneously in order to enhance the data throughput. Identification of these sectors is accomplished with the TAG_* commands. Either an arbitrary set of sectors within a single erase group, or an arbitrary selection of erase groups may be erase at one time, but not both together. That is, the unit of measure for determining an erase is either a sector or an erase group. If a set of sectors must be erased, all selected sectors must lie within the same erase group. To facilitate selection, a first command with the starting address is followed by a second command with the final address, and all sectors (or groups) within this range will be selected for erase.

21.5.5.4 Wide Bus Selection/Deselection

Wide Bus (4 bit bus width) operation mode may be selected / deselected using ACMD6. The default bus width after power up or GO_IDLE (CMD0) is 1 bit bus width. ACMD6 command is valid in 'trans state' only. That means the bus width may be changed only after a card was selected (CMD7).

21.5.6 Protection Management

Three write protect methods are supported in the host for Cards, Card internal write protect (Card's responsibility), Mechanical write protect switch (Host responsibility only) and Password protection card lock operation.

21.5.6.1 Card Internal Write Protection

Card data may be protected against either erase or write. The entire card may be permanently write protected by the manufacturer or content provider by setting the permanent or temporary write protect bits in the CSD. For cards which support write protection of groups of sectors by setting the WP_GRP_SIZE sectors as specified in the CSD), and the write protection may be changed by the

application. The SET_WRITE_PROT command sets the write protection of the addressed write-protect group, and the CLR_WRITE_PROT command clears the write protection of the addressed write-protect group.

The SEND_WRITE_PROT command is similar to a single block read command. The card shall send a data block containing 32 write protection bits (representing 32 write protect groups starting at the specified address) followed by 16 CRC bits. The address field in the write protect commands is a group address in byte units. The card will ignore all LSB's below the group size.

21.5.6.2 Mechanical write protect switch

A mechanical sliding tablet on the side of the card will be used by the user to indicate that a given card is write protected or not. If the sliding tablet is positioned in such a way that the window is open that means the card is write protected. If the window is close the card is not write protected.

A proper, matched, switch on the socket side will indicated to the host that the card is write protected or not. It is the responsibility of the host to protect the card. The position of the write protect switch is un-known to the internal circuitry of the card.

21.5.6.3 Password Protect

The password protection feature enables the host to lock a card while providing a password, which later will be used for unlocking the card. The password and its size is kept in an 128-bit PWD and 8-bit PWD_LEN registers, respectively. These registers are non-volatile so that a power cycle will not erase them.

Locked cards respond to (and execute) all commands in the basic command class (class 0) and "lock card" command class. Thus the host is allowed to reset, initialize, select, query for status, etc., but not to access data on the card. If the password was previously set (the value of PWD_LEN is not 0) will be locked automatically after power on. Similar to the existing CSD and CID register write commands the lock/unlock command is available in "trans_state" only. This means that it does not include an address argument and the card must be selected before using it. The card lock/unlock command has the structure and bus transaction type of a regular single block write command. The transferred data block includes all the required information of the command (password setting mode, PWD itself, card lock/unlock etc.). The following table describes the structure of the command data block.

Table 21-4 Command Data Block Structure

Byte#	Bit 7 Bit 6 Bit 5			Bit 4	Bit 3	Bit 2	Bit 1	Bit 0					
0	Rsv Rsv Rsv				sv Rsv Rsv ERASE LOCK_UNLOCK CLR_								
1		PWDS_LEN											
2		Password Data											

PWDS_LEN	
+ 1	

- ERASE 1 Defines Forced Erase Operation (all other bits shall be 0) and only the command byte is sent.
- LOCK/UNLOCK 1=Locks the card. 0=Unlock the card (note that it is valid to set this bit together with SET_PWD but it is not allowed to set it together with CLR_PWD).
- CLR PWD 1=Clears PWD.
- SET_PWD 1=Set new password to PWD.
- **PWD_LEN** Defines the following password length (in bytes).
- **PWD** The password (new or currently used depending on the command).

The data block size shall be defined by the host before it send the card lock/unlock command. This will allow different password sizes.

The following paragraphs define the various lock/unlock command sequences:

(1) Setting the Password:

- Select a card (CMD7), if not previously selected already
- Define the block length (CMD16), given by the 8bit card lock/unlock mode, the 8 bits password size (in bytes), and the number of bytes of the new password. In case that a password replacement is done, then the block size shall consider that both passwords, the old and the new one, are sent with the command.
- Send Card Lock/Unlock command with the appropriate data block size on the data line including 16-bit CRC. The data block shall indicate the mode (SET_PWD), the length (PWD_LEN) and the password itself. In case that a password replacement is done, then the length value (PWD_LEN) shall include both passwords, the old and the new one, and the PWD field shall include the old password (currently used) followed by the new password.
- In case that the sent old password is not correct (not equal in size and content) then LOCK_UNLOCK_FAILED error bit will be set in the status register and the old password does not change. In case that PWD matches the sent old password then the given new password and its size will be saved in the PWD and PWD LEN fields, respectively.

Note that the password length register (PWD_LEN) indicates if a password is currently set. When it equals 0 there is no password set. If the value of PWD_LEN is not equal to zero the card will lock itself after power up. It is possible to lock the card immediately in the current power session by setting the LOCK/UNLOCK bit (while setting the password) or sending additional command for card lock.

(2) Reset the password:

- Select a card (CMD7), if not previously selected already
- Define the block length (CMD16), given by the 8-bit card lock/unlock mode, the 8-bit password size (in bytes), and the number of bytes of the currently used password.
- Send the card lock/unlock command with the appropriate data block size on the data line including 16-bit CRC. The data block shall indicate the mode CLR_PWD, the length

(PWD_LEN) and the password (PWD) itself (LOCK/UNLOCK bit is don't care). If the PWD and PWD_LEN is set to 0. If the password is not correct then the LOCK UNLOCK FAILED error bit will be set in the status register.

(3) Locking a card:

- Select a card (CMD7), if not previously selected already
- Define the block length (CMD16), given by the 8-bit card lock/unlock mode, the 8-bit password size (in bytes), and the number of bytes of currently used password.
- Send the card lock/unlock command with the appropriate data block size on the data line including 16-bit CRC. The data block shall indicate the mode LOCK, the length (PWD LEN) and the password (PWD) itself.

If the PWD content equals to the sent password then the card will be locked and the card-locked status bit will be set in the status register. If the password is not correct then LOCK UNLOCK FAILED error bit will be set in the status register.

Note that it is possible to set the password and to lock the card in the same sequence. In such case the host shall perform all the required steps for setting the password (as described above) including the bit LOCK set while the new password command is sent. If the password was previously set (PWD_LEN is not 0), then the card will be locked automatically after power on reset. An attempt to lock a locked card or to lock a card that does not have a password will fail and the LOCK_UNLOCK_FAILED error bit will be set in the status register.

(1) Unlocking the card

- a) Select a card (CMD7), if not previously selected already.
- b) Define the block length (CMD16), given by the 8-bit card lock/unlock mode, the 8-bit password size (in bytes), and the number of bytes of the currently used password.
- c) Send the card lock/unlock command with the appropriate data block size on the data line including 16-bit CRC. The data block shall indicate the mode UNLOCK, the length (PWD LEN) and the password (PWD) itself.

If the PWD content equals to the sent password then the card will be unlocked and the card-locked status bit will be cleared in the status register. If the password is not correct then the LOCK_UNLOCK_FAILED error bit will be set in the status register.

Note that the unlocking is done only for the current power session. As long as the PWD is not cleared the card will be locked automatically on the next power up. The only way to unlock the card is by clearing the password. An attempt to unlock an unlocked card will fail and LOCK_UNLOCK_FAILED error bit will be set in the status register.

(2) Forcing Erase:

In case that the user forgot the password (the PWD content) it is possible to erase all the card data content along with the PWD content. This operation is called Forced Erase.

- a) Select a card (CMD7), if not previously selected already.
- b) Define the block length (CMD16) to 1 byte (8bit card lock/unlock command). Send the card lock/unlock command with the appropriate data block of one byte on the data line including 16-bit CRC. The data block shall indicate the mode ERASE (the ERASE bit shall be the only bit set).

If the ERASE bit is not the only bit in the data field then the LCOK_UNLOCK_FAILED error bit will be set in the status register and the erase request is rejected. If the command was accepted then ALL THE CARD CONTENT WILL BE ERASED including the PWD and PWD_LEN register content and the locked card will get unlocked.

An attempt to force erase on an unlocked card will fail and LOCK_UNLOCK_FAILED error bit will be set in the status register.

21.5.7 Card Status

The response format R1 contains a 32-bit field named card status. This field is intended to transmit the card's status information (which may be stored in a local status register) to the host. If not specified otherwise, the status entries are always related to the previous issued command.

Table below defines the different entries of the status. The type and clear condition fields in the table are abbreviate as follows:

Type:

- E: Error bit.
- S: Status bit.
- R: Detected and set for the actual command response.
- X: Detected and set during command execution. The host must poll the card by issuing the status command in order to read these bits.

Clear Condition:

- A: According to the card current state.
- B: Always related to the previous command. Reception of a valid command will clear it (with a delay of one command).
- C: Clear by read.

Table 21-5 Card Status Description

Bits	Identifier	Туре	Description	Clear
				Condition
31	OUT_OF_RAGE	ER	The commmand's argument was	С
			out of the allowed range for this	
			card.	
			0 – No Error

			signaling on the bus.	
			0 – No Ready.	
			1 – Ready.	
7:6	Reserved	-	-	-
5	APP_CMD	SR	The card will expect ACMD, or	С
			indication that the command has	
			been interpreted as ACMD	
			0 – Disable.	
			1 – Enable.	
4:0	Reserved	-	-	-

21.5.8 SD Status

The SD status contains status bits that are related to the SD card proprietary features and may be used for future application specific usage. The size of the SD status is one data block of 512bit. The content of this register is transmitted to the Host over the DAT bus along with 16-bit CRC. The SD status is sent to the host over the DAT bus if ACMD13 is sent (CMD55 followed with CMD13). ACMD13 can be sent to a card only in 'tran_state' (card is selected). SD status structure is described in below.

The same abbreviation for type and clear condition were used as for the Card Status above.

Table 21-6 SD Status Structure

Bits	Identifier	Туре	Description	Clear
				Condition
511:510	DAT_BUS_WIDTH	SR	Shows the currently defined data	Α

			bus width that was defined by					
			SET_BUS_WIDTH command.					
			00 – 1 (default).					
			01 – Reserved.					
			10 – 4 bit width.					
509	SECURED_MODE	SR	Card is in Secured Mode of	Α				
			operation.					
			0 – Not in the Mode.					
			10 – In the mode.					
508:496		F	Reserved					
495:480	SD_CARD_TYPE	SR	All 0, is SD Memory cards.	Α				
479:448	SIZE_OF_PROTECTED_AREA	SR	Size of protected area.	Α				
447:312	Reserved							
311:0	R	eserved	for manufacturer					

21.5.9 SDIO

I/O access differs from memory in that the registers can be written and read individually and directly without a FAT file structure or the concept of blocks (although block access is supported). These registers allow access to the IO data, control of the IO function, and report on status or transfer I/O data to and from the host.

Each SDIO card may have from 1 to 7 functions plus one memory function built into it. A function is a self contained I/O device. I/O functions may be identical or completely different from each other. All I/O functions are organized as a collection of registers, and there is a maximum of 131,072 registers possible for each I/O function.

21.5.9.1 SDIO Interrupts

In order to allow the SDIO card to interrupt the host, and interrupt function is added to a pin on the SD interface. Pin number 8 which is used as DAT[1] when operating in the 4 bit SD mode is used to signal the card's interrupt to the host. The use of interrupt is optional for each card or function within a card. The SDIO interrupt is "level sensitive", that is, the interrupt line must be held active (low) until it is either recognized and acted upon by the host or de-asserted due to the end of the Interrupt Period. Once the host has serviced the interrupt, it is cleared via an IO write to the appropriate bit in the CCCR. The interrupt output of all SDIO cards is active low. This host controller provides pull-up resistors on all data lines DAT[3:0].

As Pin 8 of the card is shared between the IRQ and DAT[1] use in the 4 bit SD mode, and interrupt shall only be sent by the card and recognized by the host during a specific time. The time that a low on Pin 8 will be recognized as an interrupt is defined as the Interrupt Period.

The host here will only sample the level of Pin 8 (DAT[1]/IRQ) into the interrupt detector during the Interrupt Period. At all other times, the host will ignore the level on Pin 8. Note that the Interrupt

Period is applicable for both memory and IO operations. The definition of the Interrupt Period is different for operations with single block and multiple block data transfer.

21.5.9.2 SDIO Suspend/Resume

Within a multi-function SDIO or a Combo (Mix IO and Memory) card, there are multiple devices (I/O and memory) that must share access to the SD bus. In order to allow the sharing of access to the host among multiple devices, SDIO and combo cards can implement the optional concept of suspend/resume. In a card supports suspend/resume, the host may temporarily halt a data transfer operation to one function or memory (suspend) in order to free the bus for a higher priority transfer to a different function of memory. Once this higher-priority transfer is complete, the original transfer is re-started where it left off (resume). The host controller here is supported by all IO functions except zero, and the memory of a combo card, and can suspend multiple transactions and resume them in any order desired. IO function zero does not support suspend/resume.

The procedure used to perform the Suspend/Resume operation on the SD bus is:

- The host determines which function currently used the DAT[] line(s).
- The host requests the lower priority or slower transaction to suspend.
- The host checks for the transaction suspension to complete.
- The host begins the higher priority transaction.
- The host waits for the completion of the higher priority transaction.
- The host restores the suspended transaction.

21.5.9.3 SDIO Read Wait

The optional Read Wait (RW) operation is defined only for the SD 1-bit and 4-bit modes. The read wait operation allows a host to signal a card that it is doing a read multiple (CMD53) operation to temporarily stall the data transfer while allowing the host to send commands to any function within the SDIO device. To determine if a card supports the Read Wait protocol, the host must test capability bits in CCCR. The timing for Read Wait is base on the Interrupt Period.

21.5.10 Clock Control

The software should guarantee that the card identification process starts in open-drain mode with the clock rate fod (0 \sim 400khz). In addition, the software should also make the card into interrupt mode with fod (only for MMC). The commands that require fod are CMD0, CMD1, CMD2, CMD3, CMD5, CMD40 and ACMD41. In data transfer mode, the MSC controller can operate card with clock rate fpp (0 \sim 25Mhz).

21.5.11 Application Specified Command Handling

The MultiMediaCard/SD system is designed to provide a standard interface for a variety applications types. In this environment it is anticipate that there will be a need for specific customers/applications features. To enable a common way of implementing these features, two types of generic commands are defined in the standard: Application Specific Command, ACMD, and General Command, GEN_CMD.

GEN_CMD, this command, when received by the card, will cause the card to interpret the following command as an application specific command, ACMD. The ACMD has the same structure as of regular MultiMediaCard standard commands and it may have the same CMD number. The card will recognize it as ACMD by the fact that it appears after APP_CMD.

The only effect of the APP_CMD is that if the command index of the, immediately, following command has an ACMD overloading, the none standard version will used. If, as an example, a card has a definition for ACMD13 but not for ACMD7 then, if received immediately after APP_CMD command, Command 13 will be interpreted as the non standard ACMD13 but, command 7 as the standard CMD7.

In order to use one of the manufacturer specific ACMD's the host will:

- (3) Send APP_CMD. The response will have the APP_CMD bit (new status bit) set signaling to the host that ACMD is now expected.
- (4) Send the required ACMD. The response will have the APP_CMD bit set, indicating that the accepted command was interpreted as ACMD. If a non-ACMD is sent then it will be respected by the card as normal MultiMediaCard command and the APP_CMD bit in the Card Status stays clear.

If a non valid command is sent (neither ACMD nor CMD) then it will be handled as a standard MultiMediaCard illegal command error.

The bus transaction of the GEN_CMD is the same as the single block read or write commands (CMD24 or CMD17). The difference is that the argument denotes the direction of the data transfer (rather than the address) and the data block is not a memory payload data but has a vendor specific format and meaning.

The card shall be selected ('tran_state') before sending CMD56. The data block size is the BLOCK_LEN that was defined with CMD16. The response to CMD56 will be R1b (card status + busy indication).

21.6 MMC/SD Controller Operation

21.6.1 Data FIFOs

The controller FIFOs for the response tokens, received data, and transmitted data are MSC_RES, MSC_RXFIFO, and MSC_TXFIFO, respectively. These FIFOs are accessible by the software and are described in the following paragraphs.

21.6.1.1 Response FIFO (MSC_RES)

The response FIFO, MSC_RES, contains the response received from an MMC/SD card after a command is sent from the controller. MSC_RES is a read-only, 16-bit, and 8-entry deep FIFO.

The FIFO will hold all possible response lengths. Responses that are only one byte long are located on the LSB of the 16-bit entry in the FIFO. The first half-word read from the response FIFO is the most significant half-word of the received response. For example, if the response format is R1, then the response read from RES_FIFO is bit [47:32], bit[31:16], bit[15:0] and in the third half-word only the low 8-bit is effective response [15:8] and the high 8-bit is ignored. If the response format is R2, then the response read from MSC_RES is bit [135:8] and needs reading 8 times.

The FIFO does not contain the response CRC. The status of the CRC check is in the status register, MSC STAT.

21.6.1.2 Receive/Transmit Data FIFO (MSC_RXFIFO/MSC_TXFIFO)

The receive data FIFO and transmit data FIFO share one 16-entry x 32-bit FIFO, because at one time data are only received or are only transmitted. If it is used to receive data, it is called MSC_RXFIFO and read-only. If it is used to transmit data, it is called MSC_TXFIFO and write-only.

Data FIFO and its controls are cleared to a starting state after a system reset or at the beginning of the operations which include data transfer (MSC_CMDAT[DATA_EN] == 1).

If at any time MSC_RXFIFO becomes full and the data transmission is not complete, the controller turns the MSC_CLK off to prevent any overflows. When the clock is off, data transmission from the card stops until the clock is turned back on. After MSC_RXFIFO is not full, the controller turns the clock on to continue data transmission. The full status of the FIFO is registered in the MSC_STAT [DATA_FIFO_FULL] bit.

If at any time MSC_TXFIFO becomes empty and the data transmission is not complete, the controller turns the MSC_CLK off to prevent any underrun. When the clock is off, data transmission to the card stops until the clock is turned back on. When MSC_TXFIFO is no longer empty, the controller automatically restarts the clock. The empty status of the FIFO is registered in the MSC_STAT [DATA_FIFO_EMPTY] bit.

The FIFO is readable on word (32-bit) boundaries. The max read/written number is 16 words. The controller can correctly process big-endian an little-endian data.

Because at the beginning of the operation which include data transfer (MSC_CMDAT [DATA_EN] == 1), Data FIFO and its controls are cleared, software should guarantee data in FIFO have been read/written before beginning a new command.

21.6.2 DMA and Program I/O

Software may communicate to the MMC controller via the DMA or program I/O.

To access MSC_RXFIFO/MSC_TXFIFO with the DMA, the software must program the DMA to read or write the FIFO with source port width 32-bit, destination port width 32-bit, transfer data size 32-byte, transfer mode single. For example, to write 64 bytes of data to the MSC_TXFIFO, the software must program the DMA as follows:

```
DMA_DCTRn = 2  // Write 2 32-bytes (64 bytes)

DMA_DCCRn[SWDH] = 0  // source port width is 32-bit

DMA_DCCRn[DWDH] = 0  // destination port width is 32-bit

DMA_DCCRn[DS] = 4  // transfer data size is 32-byte

DMA_DCCRn[TM] = 4  // transfer mode is single

DMA_DCCRn[RDIL] = 0  // request detection interval length is 0
```

The number of 32-bytes should be calculated from the number of transferred bytes as follows:

The number of words = (The number of bytes + 31) / 32

If the number of transferred bytes is not the multiple of 4, the controller can correctly process endian.

The DMA trigger level is 8 words, that is to say, the DMA read trigger is when data words in MSC_RXFIFO is >= 8 and the DMA write trigger is when data words in MSC_TXFIFO is < 8. Software can also configure DMA registers based on requirements, but the above 32-byte transfer data size is most efficient.

With program I/O, the software waits for the MSC_IREG [RXFIFO_RD_REQ] or MSC_IREG [TXFIFO_WR_REQ] interrupts before reading or writing the respective FIFO.

Note:

- 1) The MSC_CMDAT [DMA_EN] bit must be set to a 1 to enable communication with the DMA and it must be set to a 0 to enable program I/O.
- DMA can be enabled only after MSC_CMDAT is written, because MSC_CMDAT [DATA_EN] is used to reset TX/RXFIFO.

21.6.3 Start and Stop clock

The software stops the clock as follows:

- 1) Write MSC STRPCL with 0x01 to stop the MMC/SD bus clock.
- 2) Wait until MSC_STAT[CLK_EN] becomes zero.

To start the clock the software writes MSC STRPCL with 0x02.

21.6.4 Software Reset

Reset includes the MSC reset and the card reset.

The MSC reset is through MSC_STRPCL [RESET] bit.

The card reset is to make the card into idle state. CMD0 (GO_IDLE_STATE) sets the MMC and SD memory cards into idle state. CMD52 (IO_RW_DIRECT, with argument 0x88000C08) reset the SD I/O card. The MMC/SD card are initialized with a default relative card address (RCA = 0x0001 for MMC and RCA = 0x0000 for SD) and with a default driver stage register setting (lowest speed, highest driving current capability).

The following registers must be set before the clock is started:

- Step 1. Stop the clock.
- Step 2. Set MSC_STRPCL register to 0x08 to reset MSC.
- Step 3. Wait while MSC_STAT [IS_RESETTING] is 1.
- Step 4. Set MSC_CMD with CMD0.
- Step 5. Update the MSC CMDAT register as follows:
- a) Write 0x0000 to MSC_CMDAT [RESPONSE_FORMAT]
- b) Clear the MSC_CMDAT [DATA_EN] bit.
- c) Clear the MSC_CMDAT [BUSY] bit.
- d) Clear the MSC_CMDAT [INIT] bit.
- Step 6. Start the clock.
- Step 7. Start the operation (write MSC STRPCL with 0x04)
- Step 8. Wait for the END_CMD_RES interrupt.
- Step 9. Set MSC CMD with CMD52.
- Step 10. Set MSC ARG with 0x88000C08

Step 11. Update the MSC_CMDAT register as follows:

- a) Write 0x005 to MSC CMDAT [RESPONSE FORMAT]
- b) Clear the MSC_CMDAT [DATA_EN] bit.
- c) Clear the MSC CMDAT [BUSY] bit.
- d) Clear the MSC_CMDAT [INIT] bit.
- Step 12. Start the operation.
- Step 13. Wait for the END CMD RES interrupt.

21.6.5 Voltage Validation and Card Registry

At most 10 MMC and 1 SD (either SDMEM or SDIO) can be inserted MMC/SD bus at the same time, and their voltage validation and card registry steps are different, so the software should be programmed as follows:

- Step 7. Check whether SDIO card is inserted.
- Step 8. Check whether SDMEM card is inserted.
- Step 9. Check whether MMC cards are inserted.

21.6.5.1 Check SDIO

The commands are sent as follows:

- Step 8. (Optional) Send CMD52 (IO_RW_DIRECT) with argument 0x88000C08 to reset SDIO card.
- Step 9. Send CMD5 (IO SEND OP CMD) to validate voltage.
- Step 10.If the response is correct and the number of IO functions > 0, then continue, else go to check SDMEM.
- Step 11. If C-bit in the response is ready (the initialization has finished), go to 6.
- Step 12. Send CMD5 (IO_SEND_OP_CMD) to validate voltage, then go to 4.
- Step 13.If memory-present-bit in the response is true, then it is a combo card (SDIO + Memory), else it is only a SDIO card.
- Step 14. If it is a combo card, go to check SDMEM to initialize the memory part.
- Step 15.Send CMD3 (SET_RELATIVE_ADDR) to let the card publish a RCA. The RCA is returned from the response.
- Step 16. If do not accept the new RCA, go to 8, else record the new RCA.
- Step 17. Go to check MMC, because we can assure that there is no SDMEM card.

21.6.5.2 Check SDMEM

If there is no SDIO card or there is a combo card, continue to check SDMEM.

The commands are sent as follows:

- Step 1. (Optional) Send CMD0 (GO_IDLE_STATE) to reset MMC and SDMEM card. This command has no response.
- Step 2. Send CMD55. Here the default RCA 0x0000 is used for CMD55.
- Step 3. If the response is correct (CMD55 has response), then continue, else go to check
- Step 4. Send ACMD41 (SD_SEND_OP_CMD) to validate voltage (the general OCR value is 0x00FF8000).
- Step 5. If the initialization has finished, go to 7. (The response is the OCR register and it includes a status information bit (bit [31]). This status bit is set if the card power up procedure has been finished. As long as the card is busy, the corresponding bit[31] is set to LOW.)
- Step 6. Send CMD55 and ACMD41 to validate voltage, and then go to 5.
- Step 7. Send CMD2 (ALL SEND CID) to get the card CID.
- Step 8. Send CMD3 (SET_RELATIVE_ADDR) to let card publish a RCA. The RCA is returned from the response.
- Step 9. If do not accept the new RCA, go to 8, else record the new RCA.
- Step 10. Go to check MMC.

21.6.5.3 Check MMC

Because there may be several MMC card, so some steps (5 ~ 8) should be repeated several times.

The commands are sent as follows:

- Step 3. Send CMD1 (SEND_OP_CMD) to validate voltage (the general OCR value is 0x00FF88000).
- Step 4. If the response is correct, then continue, else goto 9.
- Step 5. If the initialization has finished, go to 5. (The response is the OCR register and it includes a status information bit (bit [31]). This status bit is set if the card power up procedure has been finished. As long as the card is busy, the corresponding bit[31] is set to LOW.)
- Step 6. Send CMD1 (SEND_OP_CMD) to validate voltage, and then go to 3.
- Step 7. Send CMD2 (ALL_SEND_CID) to get the card CID.
- Step 8. If the response timeout occurs, goto 9.
- Step 9. Send CMD3 (SET_RELATIVE_ADDR) to assign the card a RCA.
- Step 10. If there are other MMC cards, then go to 5.
- Step 11. Finish.

21.6.6 Single Data Block Write

In a single block write command, the following registers must be set before the operation is started:

- Step 4. Set MSC_NOB register to 0x0001.
- Step 5. Set MSC BLKLEN to the number of bytes per block.
- Step 6. Update the MSC_CMDAT register as follows:
- a) Write 0x001 to MSC CMDAT [RESPONSE FORMAT]
- b) Write 0x2 to MSC_CMDAT [BUS_WIDTH] if the card is SD, else clear it.
- Set the MSC CMDAT [DATA EN] bit.
- d) Set the MSC CMDAT [WRITE READ] bit.
- e) Clear the MSC_CMDAT [STREAM_BLOCK] bit.
- f) Clear the MSC CMDAT [BUSY] bit.
- g) Clear the MSC_CMDAT [INIT] bit.
- Step 7. Start the operation.
- Step 8. Write MSC IMASK with some value to unmask the expected interrupts.

Then the software must perform the following steps:

- Step 1. Wait for the MSC_IREG [END_CMD_RES] interrupt.
- Step 2. Wait for the MSC_IREG [DATA_TRAN_DONE] interrupt.

At the same time write data to the MSC_TXFIFO and continue until all of the data have been written to the FIFO.

- Step 3. Wait for MSC_IREG [PROG_DONE] interrupt. This interrupt indicates that the card has finished programming. Certainly software may start another command sequence on a different card.
- Step 4. Read the MSC_STAT register to verify the status of the transaction (i.e. CRC error status).

To address a different card, the software sends a select command to that card by sending a basic no data command and response transaction. To address the same card, the software must wait for MSC_IREG [PROG_DONE] interrupt. This ensures that the card is not in the busy state.

In addition, CMD26 (PROGRAM_CID), CMD27 (PROGRAM_CSD), CMD42 (LOCK/UNLOCK), CMD56 (GEN_CMD: write) and CMD53 (single_block_write) operations are similar to single block write.

21.6.7 Single Block Read

In a single block read command, the following registers must be set before the operation is started:

- Step 1. Set MSC_NOB register to 0x0001.
- Step 2. Set MSC BLKLEN register to the number of bytes per block.
- Step 3. Update the following bits in the MSC_CMDAT register:
- a) Write 0x001 to MSC CMDAT [RESPONSE FORMAT].
- b) Write 0x2 to MSC_CMDAT [BUS_WIDTH] if the card is SD, else clear it.
- c) Set the MSC CMDAT [DATA EN] bit.
- d) Clear the MSC CMDAT [WRITE READ] bit.
- e) Clear the MSC_CMDAT [STREAM_BLOCK] bit.
- f) Clear the MSC CMDAT [BUSY] bit.
- g) Clear the MSC_CMDAT [INIT] bit.
- Step 4. Start the operation.
- Step 5. Write MSC IMASK with some value to unmask the expected interrupts.

Then the software must perform the following steps:

- Step 1. Wait for the MSC IREG [END CMD RES] interrupt.
- Step 2. Wait for the MSC IREG [DATA TRAN DONE] interrupt.

At the same time read data from the MSC_RXFIFO as data becomes available in the FIFO, and continue reading until all data is read from the FIFO.

Step 3. Read the MSC_STAT register to verify the status of the transaction (i.e. CRC error status).

In addition, CMD30 (SEND_WRITE_PROT), ACMD13 (SD_STATUS), CMD56 (GEN_CMD-read), ACMD51 (SEND_SCR) and CMD53 (single_block_read) are similar to single block read.

21.6.8 Multiple Block Write

The multiple block write mode is similar to the single block write mode, except that multiple blocks of data are transferred. Each block is the same length. All the registers are set as they are for the single block write, except that the MSC NOB register is set to the number of blocks to be written.

The multiple block write mode also requires a stop transmission command, CMD12, after the data is transferred to the card. After the MSC_IREG [DATA_TRAN_DONE] interrupt occurs, the software must program the controller register to send a stop data transmission command.

If multiple block write with pre-defined block count (refer to MMC spec v-3.3) is used, CMD12 should not be sent.

For SDIO card, CMD53 (multiple_block_write) is also similar, but when IO abort (CMD52) is sent,

MSC CMDAT [IO ABORT] should be 1.

Table 21-7 How to stop multiple block write

Operation	Stop condition	Software processing
Open-ended or SDIO	After write MSC_NOB	1. Wait for DATA_TARN_DONE
infinite	blocks	interrupt
		2. Send CMD12 or CMD52 (IO abort)
		3. Wait for END_CMD_RES and
		PRG_DONE interrupt
Open-ended or SDIO	Stop writing in advance (not	1. Set MSC_STRPCL
infinite	write MSC_NOB blocks)	[EXIT_MULTIPLE]
		2. Wait for DATA_TRAN_DONE
		interrupt
		3. Send CMD12 or CMD52 (IO abort)
		4. Wait for END_CMD_RES and
		PRG_DONE interrupt.
Predefined block or	After writing MSC_NOB	1. Wait for DATA_TRAN_DONE
SDIO finite	blocks	interrupt
Predefined block or	Stop writing in advance (not	Set MSC_STRPCL [EXIT_MULTIPLE]
SDIO finite	write MSC_NOB blocks)	Wait for DATA_TRAN_DONE interrupt
		3. Send CMD12 or CMD52 (IO abort)
		4. Wait for END_CMD_RES and
		PRG_DONE interrupt

21.6.9 Multiple Block Read

The multiple blocks read mode is similar to the single block read mode, except that multiple blocks of data are transferred. Each block is the same length. All the registers are set as they are for the single block read, except that the MSC_NOB register is set to the number of blocks to be read.

The multiple blocks read mode requires a stop transmission command, CMD12, after the data from the card is received. After the MSC_IREG [DATA_TRAN_DONE] interrupt has occurred, the software must program the controller registers to send a stop data transmission command.

If multiple block read with pre-defined block count (refer to MMC spec v-3.3) is used, CMD12 should not be sent.

For SDIO card, CMD53 (multiple_block_read) is also similar, but when IO abort (CMD52) is sent, MSC_CMDAT [IO_ABORT] should be 1.

Table 21-8 How to stop multiple block read

Operation	Stop condition	Software processing				
Open-ended or SDIO	After reading MSC_NOB	Wait for DATA_TRAN_DONE interrupt				
infinite	blocks	2. Send CMD12 or CMD52 (IO abort)				

		Wait for END_CMD_RES interrupt
Open-ended or SDIO	Stop reading in advance (not	Set MSC_STRPCL [EXIT_MULTIPLE]
infinite	write MSC_NOB blocks)	Wait for DATA_TRAN_DONE interrupt
		 Send CMD12 or CMD52 (IO abort)
		 Wait for END_CMD_RES interrupt
Predefined block or	After reading MSC_NOB	Wait for DATA_TRAN_DONE
SDIO finite	blocks	interrupt
Predefined block or	Stop reading in advance (not	Set MSC_STRPCL [EXIT_MULTIPLE]
SDIO finite	write MSC_NOB blocks)	Wait for DATA_TRAN_DONE interrupt
		 Send CMD12 or CMD52 (IO abort)
		Wait for END_CMD_RES interrupt

21.6.10 Stream Write (MMC)

In a stream write command, the following registers must be set before the operation is started:

- > Update MSC CMDAT register as follows:
 - 1) Write 0x001 to the MSC_CMDAT [RESPONSE_FORMAT].
 - Clear the MSC_CMDAT [BUS_WIDTH] because only MMC support stream write
 - 3) Set the MSC_CMDAT [DATA_EN] bit.
 - 4) Set the MSC CMDAT [WRITE READ] bit.
 - 5) Set the MSC_CMDAT [STREAM_BLOCK] bit.
 - 6) Clear the MSC CMDAT [BUSY] bit.
 - 7) Clear the MSC_CMDAT [INIT] bit.
- > Start the operation.
- Write MSC IMASK with some value to unmask the expected interrupts.

Then the software must perform the following steps:

- Wait for the MSC_IREG [END_CMD_RES] interrupt.
- Write data to the MSC TXFIFO and continue until all of the data is written to the Data FIFO.
- Stop clock. Wait until MSC_STAT[CLK_EN] becomes 0. The clock must be stopped.
- Set the command registers for a stop transaction command (CMD12) and other registers.
- Start the clock and start the operation.
- Wait for the MSC_IREG [END_CMD_ERS] interrupt.
- Wait for the MSC IREG [DATA TRAN DONE] interrupt.
- Wait for the MSC_IREG [PRG_DONE] interrupt. This interrupt indicates that the card has finished programming. Certainly software may start another command sequence on a different card.
- Read the MSC_STAT register to verify the status of the transaction.

To address a different card, the software must send a select command to that card by sending a basic no data command and response transaction. To address the same card, the software must wait for MSC IREG [PRG DONE] interrupt. This ensures that the card is not in the busy state.

If partial blocks are allowed (if CSD parameter WRITE BL PARTIAL is set) the data stream can

start and stop at any address within the card address space, otherwise it shall start and stop only at block boundaries. If WRITE_BL_PARTIAL is not set, 16 more stuff bytes need to be written after the useful written data, otherwise only write the useful written data.

21.6.11 Stream Read (MMC)

In a stream read command, the following registers must be set before the operation is turned on:

- Update the MSC_CMDAT register as follows:
 - Write 0x01 to the MSC_CMDAT [RESPONSE_FORMAT]
 - o Clear the MSC_CMDAT [BUS_WIDTH] because only MMC support stream read.
 - Clear the MSC_CMDAT [WRITE_READ] bit.
 - Set the MSC CMDAT [STREAM BLOCK] bit.
 - o Clear the MSC_CMDAT [BUSY] bit.
 - Clear the MSC CMDAT [INIT] bit.
- Start the operation.
- Write MSC_IMASK with some value to unmask the expected interrupts.

Then the software must perform the following steps:

- Wait for the MSC_IREG [END_CMD_RES] interrupt.
- Read data from the MSC_RXFIFO and continue until all of the expected data has been read from the FIFO.
- Write MSC_STRPCL [EXIT_TRANSER] with 1. If MSC_STAT[DATA_FIFO_FULL] is 1, then
 read MSC_RXFIFO to make it not full. Because if data FIFO is full, MSC_CLK is stopped.
 Here, the data FIFO contains useless data.
- Set the command registers for a stop transaction command (CMD12) and send it. There is no need to stop the clock.
- Wait for the MSC IREG [END CMD RES]
- Wait for the MSC IREG [DATA TRAN DONE] interrupt.
- Read the MSC_STAT register to verify the status of the transaction.

21.6.12 Erase, Select/Deselect and Stop

For CMD7 (SELECT/DESELECT_CARD), CMD12 (STOP_TRANSMISSION) and CMD38 (ERASE), the following registers must be set before the operation is started:

- 1. Update the MSC_CMDAT register as follows:
 - a) Write 0x01 to the MSC_CMDAT [RESPONSE_FORMAT]
 - b) Clear the MSC_CMDAT [DATA_EN] bit.
 - c) Clear the MSC CMDAT [WRITE READ] bit.
 - d) Clear the MSC_CMDAT [STREAM_BLOCK] bit.
 - e) Set the MSC_CMDAT [BUSY] bit.
 - f) Clear the MSC CMDAT [INIT] bit.
- 2. Start the operation.
- 3. Write MSC IMASK with some value to unmask the expected interrupts.

Then the software must perform the following steps:

- Wait for the MSC IREG [END CMD RES] interrupt.
- Wait for the MSC_IREG [PRG_DONE] interrupt. If CMD12 is sent to terminate data read
 operation, then there is no need to wait for MSC_IREG [PRG_DONE] interrupt. This
 interrupt indicates that the card has finished programming. Certainly software may start
 another command sequence on a different card.

21.6.13 SDIO Suspend/Resume

The actual suspend/resume steps are as follows:

- 1. During data transfer, send CMD52 to require suspend. BR and RAW flag should be 1.
- 2. If BS flag in the response is 0, then suspend has been accepted and goto 4
- 3. Send CMD52 to guery card status. R flag should be 1. Go to 2.
- 4. Write MSC_STRPCL [EXIT_TRANSFER] with 1.
- 5. Wait for the MSC IREG [DATA TRAN DONE] interrupt.
- 6. Read MSC NOB, MSC SNOB and etc, save them into variables.
- 7. Set registers for high priority transfer and start it.
- 8. Wait until high priority transfer is finished.
- 9. Restore registers from variables, but MSC_NOB should be (MSC_NOB MSC_SNOB).
- 10. Send CMD52 to require resume. FSx should be resumed function number.

21.6.14 SDIO ReadWait

The actual ReadWait steps are as follows

- During multiple block read, read MSC_SNOB. If MSC_SNOB is nearby or equal to MSC_NOB, no need to use ReadWait.
- 2. Write MSC STRPCL [START READWAIT] with 1.
- 3. Wait until MSC STAT [IS READWAIT] becomes 1.
- 4. Send CMD52 to query card status.
- 5. Write MSC STRPCL [STOP READWAIT] with 1.

21.6.15 Operation and Interrupt

The software can use polling-status method to operate the MMC/SD card, but this is not the proposed method, because its performance is very low. The proposed method is to use interrupt. Generally there are fixed necessary steps to finish each command. The steps are as follows.

- 1. (Optional) Stop clock. Poll CLK EN.
- 2. Fill the registers (MSC_CMD, MSC_CMDAT, MSC_ARG, MSC_CLKRT, and etc).
- 3. (Optional) Start clock.
- 4. Start the operation. Wait for the MSC IREG [END CMD RES] interrupt.
- 5. Wait for the MSC IREG [DATA TRAN DONE] interrupt.
- 6. Send STOP_TRANS (CMD12) or I/O abort (CMD52). Wait for the MSC_IREG [END CMD ERS] interrupt.
- 7. Wait for the MSC IREG [DATA TRAN DONE] interrupt
- 8. Wait for the MSC IREG [PRG DONE] interrupt.

ACMD42	SET_CLR_CARD_DETECT	Υ	Υ	Υ	Υ			
ACMD51	SEND_SCR	Υ	Υ	Υ	Υ	Υ		

Note: For stream read/write, STOP_CMD is sent after finishing data transfer. For write, STOP_CMD is with the last six bytes. For read, STOP_CMD is sent after receiving data and card sends some data which MSC ignores.

22 I2C Bus Interface

22.1 Overview

The I2C bus was created by the Phillips Corporation and is a serial bus with a two-pin interface. The SDA data pin is used for input and output functions and the SCL clock pin is used to control and reference the I2C bus. The I2C unit allows the processor to serve as a master and slave device that resides on the I2C bus. The I2C unit enables the processor to communicate with I2C peripherals and microcontrollers for system management functions. The I2C bus requires a minimum amount of hardware to relay status and reliability information concerning the processor subsystem to an external device. The I2C unit is a peripheral device that resides on the processor internal bus. Data is transmitted to and received from the I2C bus via a buffered interface. Control and status information is relayed through a set of memory-mapped registers. Refer to *The I2C-Bus Specification* for complete details on I2C bus operation.

The I2C has the following features:

- Supports only single master mode.
- Supports I2C standard-mode and F/S-mode up to 400 kHz.
- I2C receiver and transmitter are double-buffered.
- Supports burst reading or writing of data.
- Supports random writing access of data.
- Supports general call address and START byte format after START condition.
- Independent, programmable serial clock generator.
- Supports slave coping with fast master during data transfers by holding the SCL line on a bit level.
- The number of devices that you can connect to the same I2C-bus is limited only by the maximum bus capacitance of 400pF.

22.2 Pin Description

Table 22-1 Smart Card Controller Pins Description

Name	I/O	Description
SDA	Input/Output	I2C Serial Clock Line signal.
SCL	Input/Output	I2C Serial Data/Address signal.

22.3 Register Description

Table 22-2 I2C Registers Description

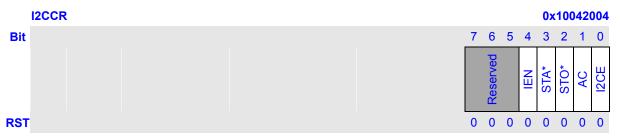

Name	RW	Reset Value	Address	Access Size
I2CDR	RW	0x??	0x10042000	8
I2CCR	RW	0x00	0x10042004	8
I2CSR	RW	0x04	0x10042008	8
I2CGR	RW	0x0000	0x1004200C	16

22.3.1 Data Register (I2CDR)

Bits	Name	Description	RW
7:0	DR	Data port of HW FIFO.	RW

22.3.2 Control Register (I2CCCR)

*Note: STA and STO can only be written with 1.

Bits	Name	Description	RW
7:5	Reserved	These bits always read as 0. Write data to these bits are ignored.	R
4	IEN	I2C interrupt bit. 0 – Disable I2C interrupt. 1 – Enable I2C interrupt.	RW
3	STA	I2C START bit. 0 – START condition will not be sent to I ² C bus. 1 –	RW
		START condition will be sent to I ² C bus.	
2	STO	I2C STOP bit. 0 – STOP condition won't be sent to I ² C bus. 1 – STOP	RW
		condition will be sent to I ² C bus.	
1	AC	I2C Acknowledge Control Bit. 0 – will be sent to I2C bus as LOW level	RW
		acknowledge signal. 1 – will be sent to I ² C bus as HIGH level	

		acknowledge signal.	
0	I2CE	Enable of I2C. 0 – I2C module is disabled. 1 – I2C module is enabled.	RW

22.3.3 Status Register (I2CSR)

Bits	Name	Description	RW
7:5	Reserved	These bits always read as 0. Write data to these bits are ignored.	R
4	STX	STA/STO Command is On. 0 – STA/STO FIFO buffer is empty. 1 –	R
		STA/STO FIFO buffer is not empty.	
3	BUSY	I2C Bus Busy. 0 – I2C bus is free. 1 – I2C bus is busy.	R
2	TEND	Transmission End Flag. 0 – Byte transmission or acknowledge bit for that	R
		byte has not completed. 1 – The I2C is in transmission idle state.	
1	DRF	Data Register Valid Flag. 0 – Data in I2CDR is invalid. 1 – Data in I2CDR	RW
		is valid.	
0	ACKF	Acknowledge Level Flag. 0 – The acknowledge signal from I ² C-bus is "0".	R
		1 – The acknowledge signal from I ² C-bus is "1".	

22.3.4 Clock Generator Register (I2CGR)

Bits	Name	Description	RW
15:01	GR	Sets the frequency of serial clock. The serial clocks frequency is	RW
		calculated as follows:	
		[Value of I2CGR] = [Frequency of Device_clock] / (16 * [SCL clock	
		rate]) – 1	

Note: To make the I2C operate normally, frequency of PCLK (APB-bus clock) should not lower than transfer 2 * [byte rate].

22.4 I²C-Bus Protocol

22.4.1 Bit Transfer

Due to the variety of different technology devices (CMOS, NMOS, bipolar) which can be connected to the I²C-bus, the levels of the logical '0' (LOW) and '1' (HIGH) are not fixed and depend on the associated level of VDD. One clock pulse is generated for each data bit transferred.

22.4.2 Data Validity

The data on the SDA line must be stable during the HIGH period of the clock. The HIGH or LOW states of the data line can only change when the clock signal on the SCL line is LOW.

22.4.3 START and STOP Conditions

A HIGH to LOW transition on the SDA line while SCL is HIGH indicates a START condition. A LOW to HIGH transition on the SDA line while SCL is HIGH defines a STOP condition.

22.4.4 Byte Format

- 3. Every byte put on the SDA line must be 8-bits width
- 4. The number of bytes that can be transmitted/received per transfer is unrestricted.
- 5. Each byte has to be followed by an acknowledge (ack/nack) bit.
- 6. Data is transferred with the most significant bit (MSB) first.
- 7. Data transfer with an acknowledge signal (acknowledge or not-acknowledge) is obligatory.
- 8. The acknowledge_ related clock pulse is generated by the master.
- The transmitter releases the SDA line (HIGH) during the acknowledge clock pulse. The receiver must pull down the SDA line during the acknowledge clock pulse so that it remains stable LOW during the HIGH period of this clock pulse.
- 10. Slave can hold the SCL line LOW during the SCL in LOW level at any bit to force the master to proceed a lower speed of transfer.

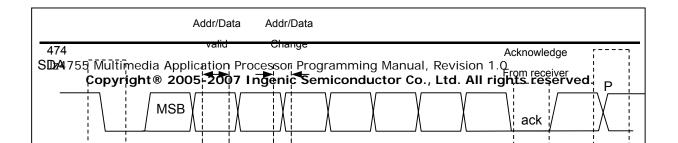

Figure 22-1 I2C-bus Protocol

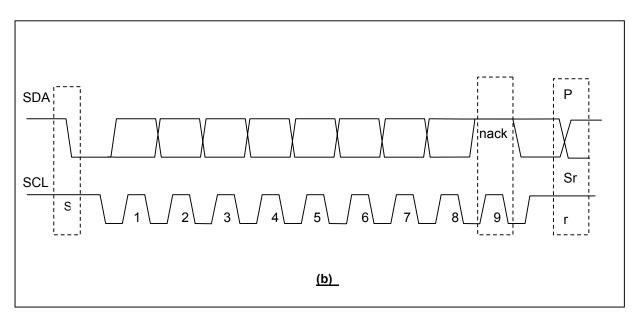

Figure 22-2 I²C-bus Protocol (cont.)

Notes:

- 1. Sr means repeated START condition. P means STOP condition.
- 2. In Fig (a), if the master does not generate Sr or P, the next data byte follows the ack.
- 3. In Fig (b), nack is received, the master generates Sr or P and the transfer terminates.

22.4.5 Data Transfer Format

22.4.5.1 First Byte

The first byte is a term indicates the address byte after START condition.

1) Normal 7-bit Address:

After the START condition, the addressing procedure for the I²C-bus is such that the first byte usually determines which slave will been selected by the master.

The first seven bits of the first byte make up the slave address. The eighth bit is the LSB (least significant bit). It determines the direction of the message. A 'zero' in the least significant position of the first byte means that the master will write information to a selected slave. A 'one' in this position means that the master will read information from the slave.

When an address is sent, each device in a system compares the first seven bits after the START condition with its address. If they match, the device considers itself addressed by the master as a slave-receiver or slave-transmitter, depending on the R/W bit.

A slave address can be made-up of a fixed and a programmable part. Since it's likely that there will be several identical devices in a system, the programmable part of the slave address enables the maximum possible number of such devices to be connected to the I²C-bus. The number of programmable address bits of a device depends on the number of pins available. For example, if a device has 4 fixed and 3 programmable address bits, a total of 8 identical devices can be connected to the same bus.

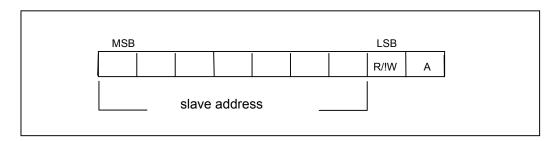

Figure 22-3 Normal 7 Bit Address after START Condition

2) General Call Address:

Address byte with all bits are "0" is defined as "general call address". When this address is used, all devices should, in theory, respond with an acknowledge. However, if a device doesn't need any of the data supplied within the general call structure, it can ignore this address by not issuing an acknowledgment. If a device does require data from a general call address, it will acknowledge this address and behave as a slave- receiver. The second and following bytes will be acknowledged by

every slave-receiver capable of handling this data. A slave that cannot process one of these bytes must ignore it by not-acknowledging.

The second byte of the general call address then defines the action to be taken.

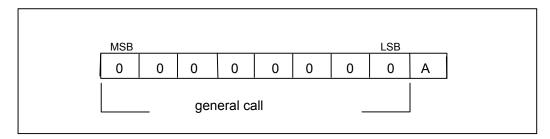

Figure 22-4 General Call Address after START Condition

3) START Byte Address:

START Byte:

After the START condition S has been transmitted by the master, data transfer can be preceded by a start procedure which is much longer than normal. The start procedure consists of:

- 1. A START condition (S)
- 2. A START byte (00000001)
- An acknowledge clock pulse (ACK)*
- 4. A repeated START condition (Sr)

Note: An acknowledge-related clock pulse is generated after the START byte. This is present only to conform to the byte handling format used on the bus. No device is allowed to acknowledge the START byte.

When the START byte (00000001) is transmitted, another microcontroller (the slave) can therefore sample the SDA line at a low sampling rate (also determined by the I2CGR) until one of the seven zeros in the START byte is detected. After detection of this LOW level on the SDA line, the microcontroller can switch to a higher sampling rate to find the repeated START condition Sr which is then used for synchronization.

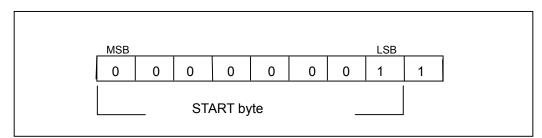

Figure 22-5 START Byte after START Condition

22.4.5.2 Transfer Format

A data transfer is always terminated by a STOP condition (P) generated by the master. However, if a master still wishes to communicate on the bus, it can generate a repeated START condition (Sr) and address another slave without first generating a STOP condition. Various combinations of read/write formats are then possible within such a transfer.

Possible data transfer formats are:

- Master-transmitter transmits to slave-receiver. The transfer direction is not changed.
- Master reads slave immediately after first byte. At the moment of the first acknowledge, the
 master-transmitter becomes a master- receiver and the slave-receiver becomes a
 slave-transmitter.
- 5. This first acknowledge is still generated by the slave. The STOP condition is generated by the master, which has previously sent a not-acknowledge.

Notes:

- 3. Combined formats can be used, for example, to control a serial memory. During the first data byte, the internal memory location has to be written. After the START condition and slave address is repeated, data can be transferred.
- 4. All decisions on auto-increment or decrement of previously accessed memory locations etc. are taken by the designer of the device.
- 5. Each byte is followed by an acknowledgment bit as indicated by the 'A 'or '!A ' blocks in the sequence.

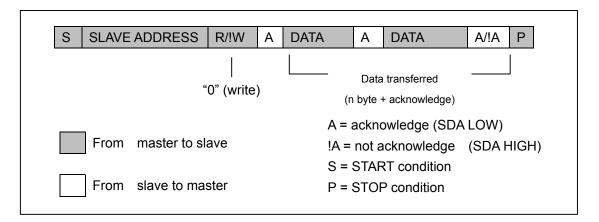

Figure 22-6 A Master-Transmitter Addresses a Slave Receiver with a 7-Bit Address

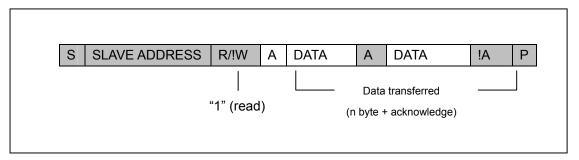

Figure 22-7 A Master Reads the Slave Immediately after the First Byte (Master-Receiver)

22.5 I2C Operation

22.5.1 I2C Initialization

Before transmitting and receiving data, set the I2CE bit in I2CCR to 1 to enable I2C operation and set I2CGR for proper serial clock frequency. Set the I2CE bit to 0 after transmitting or receiving data for low power dissipation.

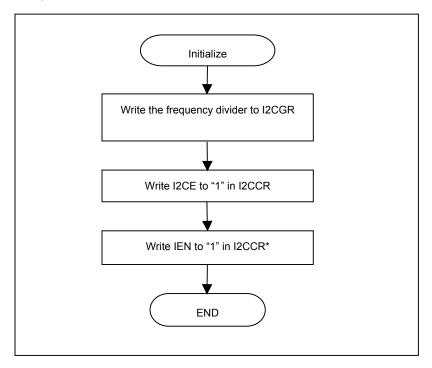

Figure 22-8 I2C Initialization

Note: This step is selectable.

22.5.2 Write Operation

Following figure illustrates the flow of a write operation.

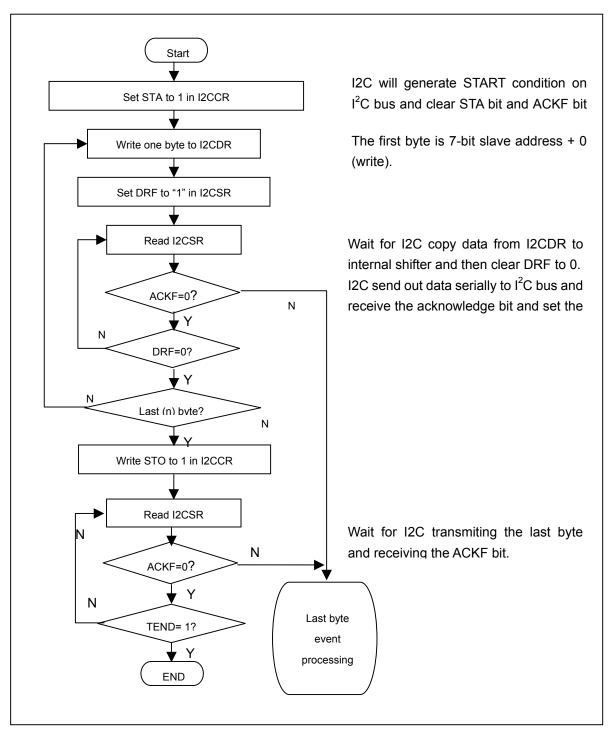

Figure 22-9 I2C Write Operation Flowchart

22.5.3 Read Operation

Following figure illustrates the flow of read operation.

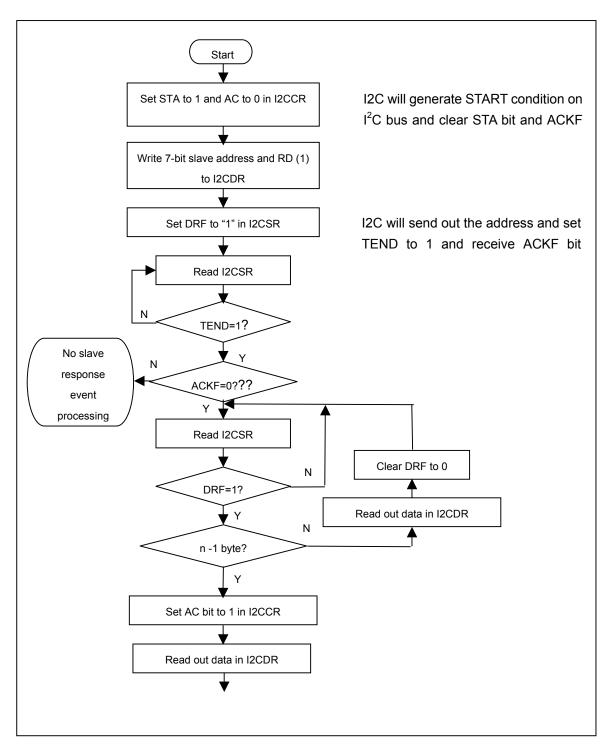

Figure 22-10 I2C Read Operation Flowchart

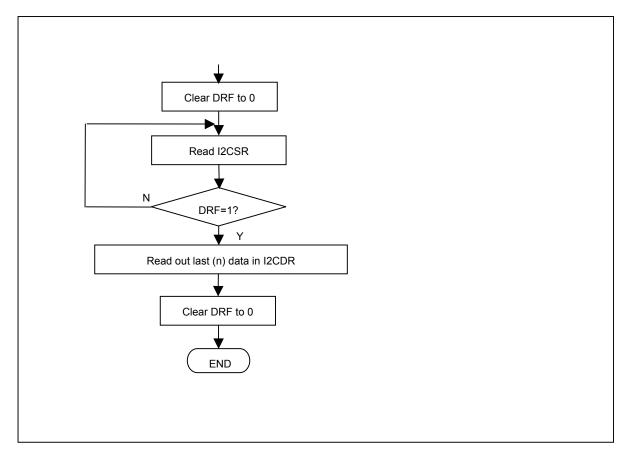

Figure 22-11 Read Operation Flowchart (cont.)

23 Synchronous Serial Interface

23.1 Overview

The SSI is a full-duplex synchronous serial interface and can connect to a variety of external analog-to-digital (A/D) converters, audio and telecom codecs, and other devices that use serial protocols for transferring data. The SSI supports National's Microwire, Texas Instruments Synchronous Serial Protocol (SSP), and Motorola's Serial Peripheral Interface (SPI) protocol.

The SSI operates in master mode (the attached peripheral functions as a slave) and supports serial bit rates from 7.2 KHz to 54 MHz. Serial data formats may range from 2 to 17 bits in length. The SSI provides 128 entries deep x 17 bits wide transmit and receive data FIFOs.

The FIFOs may be loaded or emptied by the Central Processor Unit (CPU) using programmed I/O, or DMA transfers while receiving or transmitting.

Features:

- 3 protocols support: National's Microwire, TI's SSP, and Motorola's SPI
- Full-duplex or transmit-only or receive-only operation
- Programmable transfer order: MSB first or LSB first
- 128 entries deep x 17 bits wide transmit and receive data FIFOs
- Configurable normal transfer mode or Interval transfer mode
- Programmable clock phase and polarity for Motorola's SSI format
- Two slave select signal (SSI_CE_ / SSI_CE2_) supporting up to 2 slave devices
- Back-to-back character transmission/reception mode
- Loop back mode for testing

23.2 Pin Description

Table 23-1 Micro Printer Controller Pins Description

Name	I/O	Description
SSI_CLK	Output	Serial bit-rate clock
SSI_CE_	Output	First slave select enable
SSI_CE2_	Output	Second slave select enable
SSI_GPC	Output	General purpose control signal to external chip
SSI_DT	Output	Transmit data (serial data out)
SSI_DR	Input	Receive data (serial data in)

SSI_CLK is the bit-rate clock driven from the SSI to the peripheral. SSI_CLK is toggled only when data is actively being transmitted and received.

SSI_CE_ or SSI_CE2_ are the framing signal, indicating the beginning and the end of a serialized data word.

SSI_DT and SSI_DR are the Transmit and Receive serial data lines.

SSI_GPC is general-purpose control signal, synchronized with SSI_CLK, can be used for LCD control.

23.3 Register Description

The SSI has seven registers: one data, two control, one status, one bit-rate control, and two interval control registers. The table lists these registers.

Table 23-2 SSI Serial Port Registers

Name	RW	Reset Value	Address	Access Size
SSIDR	RW	0x??	0x10043000	32
SSICR0	RW	0x0000	0x10043004	16
SSICR1	RW	0x00087860	0x10043008	32
SSISR	RW	0x00000098	0x1004300C	32
SSIITR	RW	0x0000	0x10043010	16
SSIICR	RW	0x00	0x10043014	8
SSIGR	RW	0x0000	0x10043018	16

Note: There two SSI controller. SSI0 whose base address is 0x100430xx and SSI1 whose base address is 0x100450xx.

23.3.1 SSI Data Register (SSIDR)

	SSI	IDR																											0x	100	430	000
Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
							Res	ser\	/ed							GPC/D16					7	ran	smi	t/R	ece	ive	Dat	а				
RST	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?

Bits	Name	Description	RW
31:17	Reserved		R
16	GPC/D16	This bit can be used as normal data bus bit 16 or GPC bit alternatively.	RW
		When it is used as normal data bus bit, it's readable / writable; when	
		SSI_GPC is used, it is GPC bit for SSI_GPC pin output and it's write-only	
15:0	Transmit/	Data word to be written to/read from Transmit/Receive FIFO.	RW
	Receive	When the transfer frame length is less than 17-bit, received data is	
	Data	automatically right justified in the receive-FIFO and the upper unused bits	
		are filled with '0'. For transmission, the upper unused bits of the data	
		written into SSIDR is ignored by the transmit logic. (Note: "upper unused	
		bits" does not include the SSIDR.GPC bit.	
		National microwire format includes format 1 and format2, when national	
		microwire format 2 is selected, Bit 16 of SSIDR is defined as read/write	

operation judge bit, if it is 0, bit 15~0 represent one read command; if it is	
1, bit 15~0 represent one write command and following is the written	
data. So the maximum length of one command (is defined in MCOM) is	
16, the maximum length of one written or read data (is defined in FLEN)	
can be 17.	
Transmit-FIFO only contain one read operation command once, or one	
write operation command and its data once, after transmit-FIFO is empty,	
next command can be filled in transmit-FIFO.	

23.3.2 SSI Control Register0 (SSICR0)

Bits	Name	Description	RW
15	SSIE	This bit is used to enable/disable SSI module: 0 – disable; 1 – enable	RW
		Clearing SSIE will not reset SSI FIFO, SSICR0, SSICR1, SSIGR, SSIITR	
		and SSIICR automatically. Software should ensure the FIFOs/registers are	
		properly configured and be flush/reset manually when necessary before	
		enabling SSI.	
14	TIE	This bit enables/disables the transmit-FIFO half-empty interrupt TXI:	RW
		0 – disable; 1 – enable	
13	RIE	This bit enables/disables the receive-FIFO half-full interrupt RXI:	RW
		0 – disable; 1 – enable	
12	TEIE	This bit enables/disables the transmit-error interrupt TEI:	RW
		0 – disable; 1 – enable	
11	REIE	This bit enables/disables the receive-error interrupt REI:	RW
		0 – disable; 1 – enable	
10	LOOP	Used for test purpose. In loop mode, the output of SSI transmit shift register	RW
		is connected to input of SSI receive shift register internally. The data	
		received should be the same as the data transmitted. And do not output	
		any valid signals on the pins.	
		0 – normal SSI mode; 1 – LOOP mode	

9	RFINE	This bit enables/disables	The receiv	e finish co	ndition list below:	RW					
		receive finish control	RFINE	RFINC	Receive Finish						
		function:			Condition						
		0 – disable; 1 – enable.	0	х	Same as transmit						
		For SSICR1.FMAT = B'10			completion condition						
		(National Microwire			(transmit-fifo is empty						
		format 1 is selected),			and SSICR1.UNFIN =						
		SSICR0.RFINE must be 0			0)						
8	RFINC*	Receive finish control bit:	1	0	Receive continue	RW					
		0 – receive continue;	1	1	Receive finish						
		1 – receive finished									
7	EACLRU	 don't auto clear 	under flag,	software o	clear under	RW					
	N	2. – software auto o	clear under	flag when	tfifo don't empty						
6	FSEL	This bit sets the frame signal	al to be use	d for slave	select. The unselected	RW					
		frame signal always output	invalid leve	l.							
		0 – SSI_CE_ is selected;									
		1 – SSI_CE2_ is selected.									
5:4	Reserved					R					
3	TFMODE	0 – new fifo empty mode				RW					
		1 – old fifo empty mode									
2	TFLUSH	Flush the transmit FIFO wh	en set to 1.	Always re	turn 0 when read.	RW					
1	RFLUSH	Flush the receive FIFO whe	en set to 1.	Always retu	urn 0 when read.	RW					
0	DISREV	This bit enables/disables re	is bit enables/disables receive function: 0 – enable; 1 – disable								

Note: *: 1) When transmitting finished or for receive-only operation, transmit function can be disabled and this bit is used to control receiving completion, and the SSI will consume less power.

2) When the finish condition is set, the receiving will complete after present character is completely shifted in, then the SSI will stop the SSI_CLK and negate the SSI_CE_ / SSI_CE2_ if necessary. To make sure present transfer is completed, user must read and get SSISR.END = 1 (or SSISR.BUSY = 0).

Bits	Name	Description	RW
31:24	Reserved		R
23:16	TFIFO-NUM	These bits indicate the Characters Number in Transmit-FIFO.	R
15:8	RFIFO-NUM	These bits indicate the Characters Number in Transmit-FIFO.	R
7	END	This bit indicates transfer end status. It is the inverse of SSISR.BUSY	R
		when transfer is in process, but it'll keep cleared at interval time	
		before transfer is completed. It'll be set when transfer finished.	
6	BUSY	This bit indicates SSI's working status.	R
		0 – SSI is idle or at interval time; 1 – Transmission and/or reception is	
		in process.	
5	TFF	This bit denotes transmit-FIFO is full or not.	R
		0 – Transmit-FIFO is not full; 1 – Transmit-FIFO is full.	

4	RFE	This bit denotes receive-FIFO is empty or not.	R
		0 – Receive-FIFO is not empty; 1 – Receive-FIFO is empty.	
3	TFHE	This bit denotes whether the characters number in transmit-FIFO	R
		being less or equal to SSICR1.TTRG.	
		0 – The data in transmit-FIFO is more than the condition set by	
		SSICR1.TTRG;	
		1 – The data in transmit-FIFO meets the condition set by	
		SSICR1.TTRG, If SSICR0.TIE = 1, it will generate SSI TXI interrupt.	
2	RFHF	This bit denotes whether the characters number in receive-FIFO	R
		being more or equal to the number set by SSICR1.RTRG.	
		0 – The data in receive-FIFO is less than the condition set by	
		SSICR1.RTRG	
		1 – The data in receive-FIFO meets the condition set by	
		SSICR1.RTRG, If SSICR0.RIE = 1, it will generate SSI RXI interrupt.	
1	UNDR	Transmit-FIFO underrun status. When underrun happens, SSI set this	RW
		bit and keeps the current status of SSI_CLK and SSI_CE_/SSI_CE2_,	
		waiting for transmit-FIFO filling.	
		0 – Underrun has not occurred;	
		1 – Underrun has occurred, when SSICR0.TEIE is set, it will generate	
		SSI TEI interrupt. Write '0' to clear this bit, writing '1' has no effect.	
0	OVER	Receive-FIFO overrun status, new received data will lose.	RW
		0 – Overrun has not occurred;	
		1 – Overrun has occurred, When SSICR0.REIE is set, it will generate	
		SSI REI interrupt. Write '0' to clear this bit, writing '1' has no effect.	

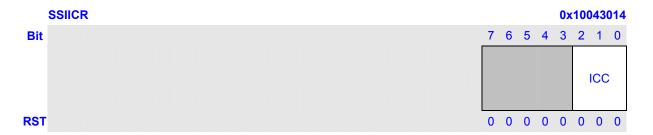

23.3.5 SSI Interval Time Control Register (SSIITR)

Bits	Name	Description	RW
15	CNTCLK	Counting clock source select.	RW
		0 – Use SSI bit clock (SSI_CLK) as the interval counter clock source;	
		1 – Use 32K clock as the interval counter clock source.	
14:0	IVLTM	Interval time set, set the cycle number of counting clock source for	RW
		desired interval time. When SSIITR.IVLTM = 0x0000, normal mode is	
		selected, and SSIITR.CNTCLK and SSIICR are ignored. When	
		SSIITR.IVLTM ≠ 0x0000, interval mode is selected. The interval time is	
		calculated as follows:	
		Interval time ≈ [CNTCLK clock period] * [Value of IVLTM]	
		The actual interval time is as follow:	
		When SSIITR.CNTCLK = 0:	
		Interval time = [CNTCLK clock period] * [Value of IVLTM] + 3 *	
		device_clock period	
		When SSIITR.CNTCLK = 1:	
		Interval time ≥ [CNTCLK clock period] * [Value of IVLTM + 1] + 1 *	
		device_clock period;	
		Interval time ≤ [CNTCLK clock period] * [Value of IVLTM + 2] + 2 *	
		device_clock period	

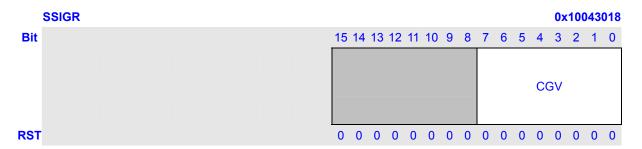

23.3.6 SSI Interval Character-per-frame Control Register (SSIICR)

Bits	Name	Description	RW
7:3	Reserved		R
2:0	ICC	Sets the fixed number of characters to be transmitted / received each	RW
		time during SSI_CLK changing (and SSI_CE_ / SSI_CE2_ asserting) in	
		interval mode for SSICR1.FMAT = B'00 (Motorola's SPI format is	
		selected). SSIICR is ignored for SSICR1.FMAT ≠ B'00.	
		The desired transfer number of characters-per-frame is (SSIICR set	
		value + 1).	

23.3.7 SSI Clock Generator Register (SSIGR)

Bits	Name	Description	RW
15:8	Reserved		R
7:0	CGV	Sets the frequency of serial bit clock (SSI_CLK). The serial bit clock	RW
		(SSI_CLK) is generated by dividing device-clock as follows:	
		F _{SSI_CLK} = [Frequency of device clock] / (2 * (CGV + 1))	
		Device clock is generated in CPM module. The value in SSIGR can be	
		set from 0 to 255, and initialized to 0x0000 on power-on reset.	

23.4 Functional Description

Serial data is transferred between the processor and external peripheral through FIFO buffers in the SSI. Data transfers to system memory are handled by either the CPU (using programmed I/O) or by DMA. Operation is full duplex - separate buffers and serial data paths permit simultaneous transfers to and from the external peripheral.

Programmed I/O transmits and receives data directly between the CPU and the transmit/receive FIFO's. The DMA controller transfers data during transmit and receive operations between memory and the FIFO's.

Transmit data is written by the CPU or DMA to the SSI's transmit FIFO. The SSI then takes the data from the FIFO, serializes it, and transmits it via the SSI_DT signal to the peripheral. Data from the peripheral is received via the SSI_DR signal, converted to parallel words and is stored in the Receive FIFO. Read operations automatically target the receive FIFO, while write operations write data to the transmit FIFO. Both the transmit and receive FIFO buffers are 128 entries deep by 17 bits wide. As the received data fills the receive FIFO, a programmable threshold triggers an interrupt to the Interrupt Controller. If enabled, an interrupt service routine responds by identifying the source of the interrupt and then performs one or several read operations from the inbound (receive) FIFO buffer.

23.5 Data Formats

Four signals are used to transfer data between the processor and external peripheral. The SSI supports three formats: Motorola SPI, Texas Instruments SSP, and National Microwire. Although they have the same basic structure the three formats have significant differences, as described below.

SSI_CE_/SSI_CE2_ varies for each protocol as follows:

- For SPI and Microwire formats, SSI_CE_/SSI_CE2_ functions as a chip select to enable the external device (target of the transfer), and is held active-low during the data transfer.
- For SSP format, this signal is pulsed high for one serial bit-clock period at the start of each frame.

SSI CLK varies for each protocol as follows:

- For Microwire, both transmit and receive data sources switch data on the falling edge of SSI_CLK, and sample incoming data on the rising edge.
- For SSP, transmit and receive data sources switch data on the rising edge of SSI_CLK, and sample incoming data on the falling edge.
- For SPI, the user has the choice of which edge of SSI_CLK to use for switching outgoing data, and for sampling incoming data. In addition, the user can move the phase of SSI_CLK, shifting its active state one-half period earlier or later at the start and end of a frame.

While SSP and SPI are full-duplex protocols, Microwire uses a half-duplex master-slave messaging protocol. At the start of a frame, a 1 or 2-byte control message is transmitted from the controller to the peripheral. The peripheral does not send any data. The peripheral interprets the message and, if it is a READ request, responds with requested data, one clock after the last bit of the requesting message.

The serial clock (SSI_CLK) only toggles during an active frame. At other times it is held in an inactive or idle state, as defined by its specified protocol.

23.5.1 Motorola's SPI Format Details

23.5.1.1 General Single Transfer Formats

The figures below show the timing of general single transfer format.

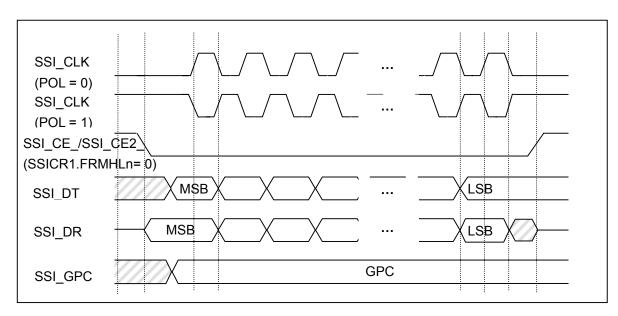

Figure 23-1 SPI Single Character Transfer Format (PHA = 0)

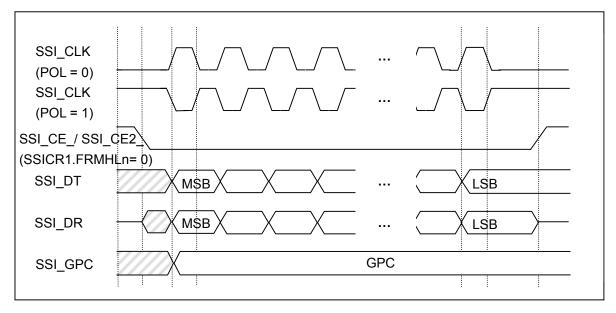

Figure 23-2 SPI Single Character Transfer Format (PHA = 1)

For SSICR1.PHA = 0, when SSICR1.TFVCK = B'00, hardware ensures the first clock edge appears one SSI_CLK period after SSI_CE_ / SSI_CE2_ goes valid; when SSICR1.TCKFI = B'00, hardware ensures the SSI_CE_ / SSI_CE2_ negated half SSI_CLK period after last clock change edge; when SSICR1.TFVCK \neq B'00 or SSICR1.TCKFI \neq B'00, 1/2/3 more clock cycles are inserted.

For SSICR1.PHA = 1, when SSICR1.TFVCK = B'00, hardware ensures the first clock edge appears half SSI_CLK period after SSI_CE_ / SSI_CE2_ goes valid; when SSICR1.TCKFI = B'00, hardware ensures the SSI_CE_ / SSI_CE2_ negated one SSI_CLK period after last clock change edge; when SSICR1.TFVCK \neq B'00 or SSICR1.TCKFI \neq B'00, 1/2/3 more clock cycles are inserted.

Data is sampled from SSI_DR at every rising edge (when PHA = 0, POL = 0 or PHA = 1, POL = 1) or at every falling edge (when PHA = 0, POL = 1 or PHA = 1, POL = 0). According to SPI protocol, input data on SSI_DR should be stable at every sample clock edge.

Drive data onto SSI_DT at every rising edge (when PHA = 0, POL = 1 or PHA = 1, POL = 0) or at every falling edge (when PHA = 0, POL = 0 or PHA = 1, POL = 1).

23.5.1.2 Back-to-Back Transfer Formats

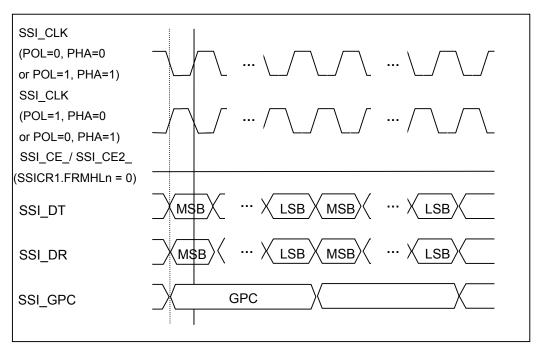

Figure 23-3 SPI Back-to-Back Transfer Format

For Motorola's SPI format transfers those continuous characters are exchanged during SSI_CE_ / SSI_CE2_ being valid, the timing is illustrated in the figure (SSICR1.LFST = 0).

Back-to-back transfer is performed as transmit-only/full-duplex operation when transmit-FIFO is not empty before the completion of the last character's transfer or performed as receive-only operation.

23.5.1.3 Frame Interval Mode Transfer Format

When in interval mode (SSIITR. IVLTM \neq '0'), SSI always wait for an interval time (SSIITR.IVLTM), transfer fixed number of characters (SSIICR), then repeats the operation.

When SSICR0.RFINE = 1, if transmit-FIFO is still empty after the interval time, receive-only transfer will occur.

During interval-wait time, SSI stops SSI_CLK, and when SSICR1.ITFRM = 0 it negates the SSI_CE_ / SSI_CE2_, when SSICR1.ITFRM = 1 it keeps asserting the SSI_CE_ / SSI_CE2_.

For transfers finished with transmit-FIFO empty, if the SSI transmit-FIFO is empty before fixed number of characters being loaded to transfer (SSICR1.UNFIN must be 1), then the SSI will set SSISR.UNDR = 1; if enabled, it'll send out a SSI underrun interrupt. At the same time, SSI will hold the SSI_CE_ / SSI_CE2_ and SSI_CLK signals at current status and wait for the transmit-FIFO filling. The SSI will continue transfer after transmit-FIFO being filled. The SSI always stops after completion of fixed number of characters' transfer (SSICR1.UNFIN must be 0) with transmit-FIFO empty.

For transfers finished by SSICR0.RFINC being valid set, the SSI will stop after finished current character transfer and needn't wait for a whole completion of fixed number of characters' transfer.

Two Interval transfer mode are illustrated in the following figures. In these timing diagram, SSICR1.PHA = 0, SSICR1.POL = 0 and SSIICR = 0.

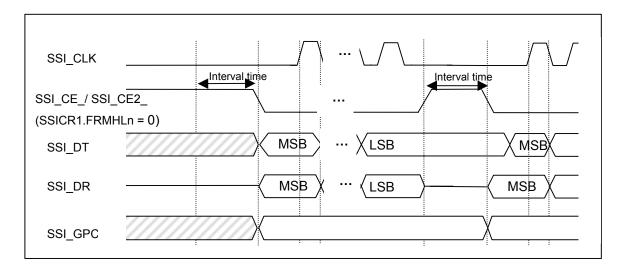

Figure 23-4 SPI Frame Interval Mode Transfer Format (ITFRM = 0, LFST = 0)

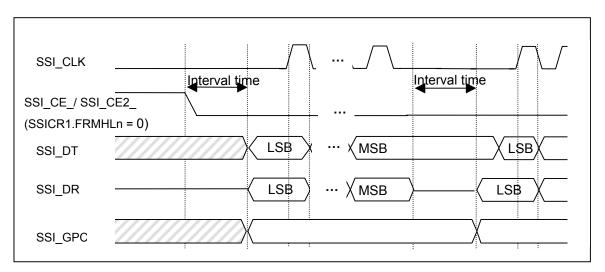

Figure 23-5 SPI Frame Interval Mode Transfer Format (ITFRM = 1, LFST = 1)

23.5.2 TI's SSP Format Details

In this format, each transfer begins with SSI_CE_ pulsed high for one SSI_CLK period. Then both master and slave drive data at SSI_CLK's rising edge and sample data at the falling edge. Data are transferred with MSB first or LSB first. At the end of the transfer, SSI_DT retains the value of the last bit sent through the next idle period.

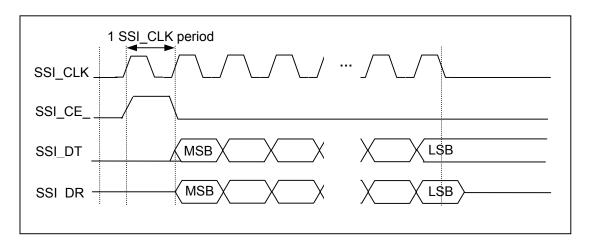

Figure 23-6 TI's SSP Single Transfer Format

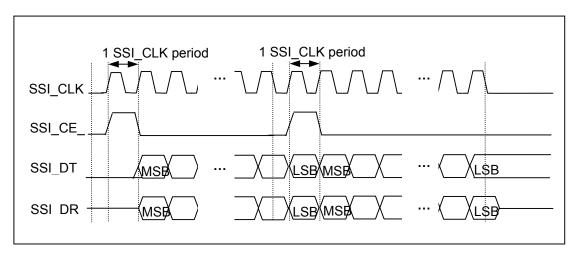

Figure 23-7 TI's SSP Back-to-back Transfer Format

23.5.3 National Microwire Format Details

It supports format 1 and format 2. If format 1 is selected, both master and slave drive data at SSI_CLK falling edge and sample data at the rising edge. If format 2 is selected, master drive and sample data at SSI_CLK falling edge, slave drive and sample data at SSI_CLK rising edge. SSI_CLK goes high midway through the command's most significant bit (or LSB) and continues to toggle at the bit rate. One bit clock (format 1) or half one bit clock (format 2) period after the last command bit, the external slave must return the serial data requested, with most significant bit first (or LSB first) on SSI_DR. SSI_CE_ / SSI_CE2 deasserts high half clock (SSI_CLK) period (and 1/2/3 additional clock periods) later. Format 1 support back-to-back transfer, the start and end of back-to-back transfers are similar to those of a single transfer. However, SSI_CE_ / SSI_CE2 remains asserted throughout the transfer. The end of a character data on SSI_DR is immediately followed by the start of the next command byte on SSI_DT.

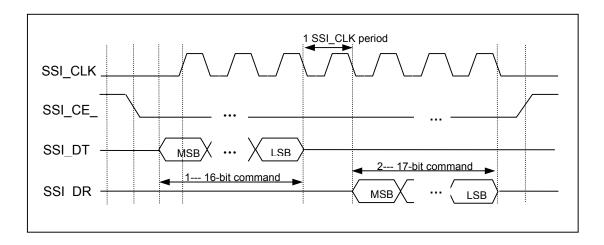

Figure 23-8 National Microwire Format 1 Single Transfer

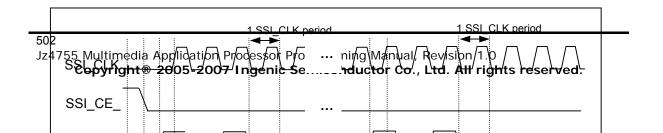

Figure 23-9 National Microwire Format 1 Back-to-back Transfer

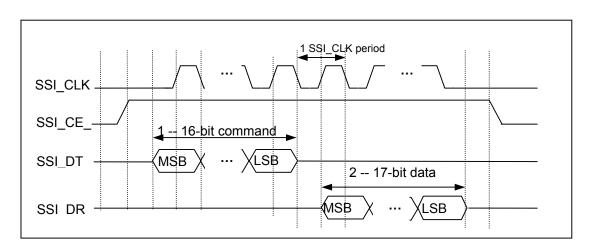

Figure 23-10 National Microwire Format 2 Read Timing

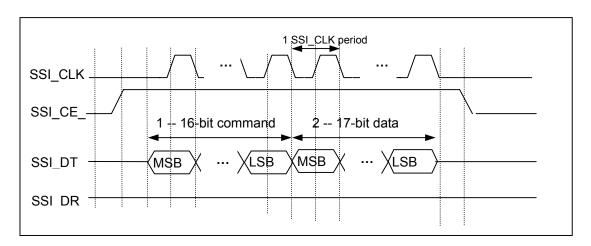

Figure 23-11 National Microwire Format 2 Write Timing

23.6 Interrupt Operation

In SSI, there are TXI, RXI, TEI and REI total 4 interrupts, all these interrupts are combined together to make one SSI interrupt, which can be masked by writing '1' into corresponding mask bit in INTC interrupt mask register (IMR).

Table 23-3 SSI Interrupts

Operation	Condition	Flag Bit	Mask Bit	Interrupt	DMAC Activation
Transmit	T-FIFO is half-empty or less	SSISR.TFHE	SSICR0.TIE	TXI	Possible
	Transmit underrun error	SSISR.UNDR	SSICR0.TEIE	TEI	Impossible
Receive	R-FIFO is half-full or more	SSISR.RFHF	SSICR0.RIE	RXI	Possible
	Receive overrun error	SSISR.OVER	SSICR0.REIE	REI	Impossible

Either SSISR.TFHE or SSISR.RFHF can activate DMA transferring when corresponding individual interrupt mask bit in SSICR0 is cleared (masked) and DMA is enabled and configured.

24 UART Interface

24.1 Overview

This chapter describes the universal asynchronous receiver/transmitter (UART) serial ports. There are three UARTs: All UARTs use the same programming model. Each of the serial ports can operate in interrupt based mode or DMA-based mode.

The Universal asynchronous receiver/transmitter (UART) is compatible with the 16550-industry standard and can be used as slow infrared asynchronous interface that conforms to the Infrared Data Association (IrDA) serial infrared specification 1.1.

24.1.1 Features

- Full-duplex operation
- 5-, 6-, 7- or 8-bit characters with optional no parity or even or odd parity and with 1, 1½, or 2 stop bits
- 32x8 bit transmit FIFO and 32x11bit receive FIFO
- Independently controlled transmit, receive (data ready or timeout), line status interrupts
- Internal diagnostic capability Loopback control and break, parity, overrun and framing-error is provided
- Separate DMA requests for transmit and receive data services in FIFO mode
- Supports modem flow control by software or hardware
- Slow infrared asynchronous interface that conforms to IrDA specification

24.1.2 Pin Description

Table 24-1 UART Pins Description

Name	Туре	Description
RxD	Input	Receive data input
TxD	Output	Transmit data output
CTS_	Input	Clear to Send — Modem Transmission enabled
RTS_	Output	Request to Send — UART Transmission request

Note: UART2, UART0 support RxD, TxD, RTS_, CTS_, UART1 supports only RxD, TxD.

24.2 Register Descriptions

All UART register 32-bit access address is physical address. When ULCR.DLAB is 0, URBR, UTHR and UIER can be accessed; When ULCR.DLAB is 1, UDLLR and UDLHR can be accessed.

Table 24-2 UART Registers Description

24.2.1 UART Receive Buffer Register (URBR)

The read-only URBR is corresponded to one level 11bit buffer in non-FIFO mode and a 32x11bit FIFO that holds the character(s) received by the UART. Bits in URBR are right justified when being configured to use fewer than eight bits, and the rest of most significant data bits are zeroed and the most significant three bits of each buffer are the status for the character in the buffer. If ULSR.DRY is 0, don't read URBR, otherwise wrong operation may occur.

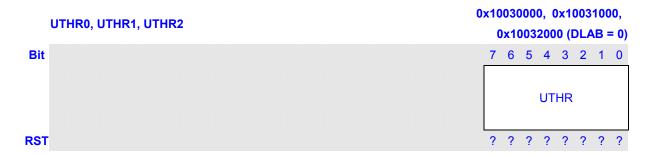

Bits	Name	Description	RW
7:0	URBR	8-bit UART receive read data	R

24.2.2 UART Transmit Hold Register (UTHR)

The write-only UTHR is corresponded to one leve 8 bit buffer in non-FIFO mode and a 32x8bit FIFO in FIFO mode that holds the data byte(s) to be transmitted next.

Bits	Name	Description	RW
7:0	UTHR	8-bit UART transmit write hold data	W

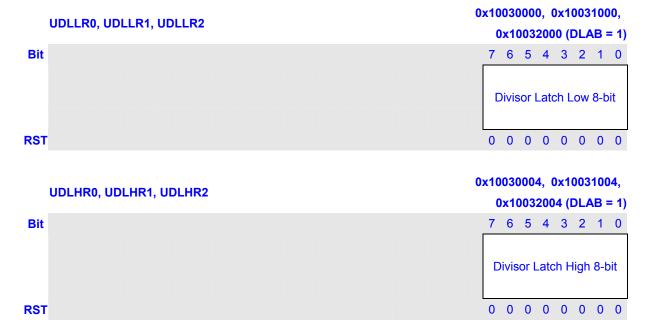

24.2.3 UART Divisor Latch Low/High Register (UDLLR / UDLHR)

UART Divisor Latch registers, UDLLR/UDLHR together compose the divisor for the programmable baud rate generator that can take the UART device clock and divide it by 1 to $(2^{16} - 1)$.

The UART device source clock is EXCLK or EXCLK/2 that is determined by CPCCR.ECS. UDLHR/UDLLR stores the high/low 8-bit of the divisor respectively. Load these divisor latches during initialization to ensure that the baud rate generator operates properly. If both Divisor Latch registers are 0, the 16X clock stops.

If you don't set UMR and UACR, UART will work at normal mode with the specified frequency. The relationship between baud rate and the value of Divisor is shown by the formula when UMR and UACR are not set:

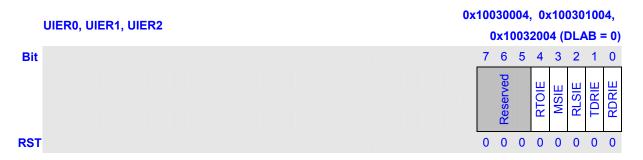

Baud Rate = (UART device clock) / (16 * Divisor)

24.2.4 UART Interrupt Enable Register (UIER)

The UART Interrupt Enable Register (UIER) contains the interrupt enable bits for the five types of interrupts (receive data ready, timeout, line status, and transmit data request, and modem status) that set a value in UIIR.

Bits	Name	Description	RW
7:5	Reserved	Always read 0, write is ignored	
4	RTOIE	Receive Timeout Interrupt Enable	
		0 = Disable the receive timeout interrupt	
		1 = Enable the receive timeout interrupt	
		Timeout means the URDR (FIFO mode) is not empty but no character has	
		received for a period of time T: T (bits) = 4 X Word length + 12	
3	MSIE	Modem Status Interrupt Enable	RW
		0 = Disable the modem status interrupt	
		1 = Enable the modem status interrupt	
2	RLSIE	Receive Line Status Interrupt Enable	RW
		0 = Disable receive line status interrupt	
		1 = Enable receive line status interrupt	
1	TDRIE	Transmit Data Request Interrupt Enable	RW
		0 = Disable the transmit data request interrupt	
		1 = Enable the transmit data request interrupt	
0	RDRIE	Receive Data Ready Interrupt Enable	RW
		0 = Disable the receive data ready interrupt	
		1 = Enable the receive data ready interrupt	

24.2.5 UART Interrupt Identification Register (UIIR)

The read-only UART Interrupt Identification Register (UIIR) records the prioritized pending interrupt source information. Its initial value after power-on reset is 0x01.

Bits	Name	Description R			
7:6	FFMSEL	FIFO Mode Select			
		0b00 = No	n-FIFO mode		
		0b01 = Re	served		
		0b10 = Re	served		
		0b11 = FIF	O mode		
5:4	Reserved	Always rea	d 0, write is ignored	R	
3:1	INID	Interrupt I	dentifier	R	
		These bits	identify the current highest priority pending interrupt.		
		INID	Description		
		0b000	Modem Status		
		0b001	Transmit Data Request		
		0b010	Receive Data Ready		
		0b011	Receive Line Status		
		0b100	Reserved		
		0b101	Reserved		
		0b110	Receive Time Out		
		0b111	Reserved		
		See Table	See Table 24-3 for details		
0	INPEND	Interrupt F	Interrupt Pending		
		0 = interru	0 = interrupt is pending		
		1 = No inte	1 = No interrupt pending		

Table 24-3 UART Interrupt Identification Register Description

UIIR.INID	Interrupt Set/Clear Cause				
	Priority	Type	Source	Clear Condition	
0b0001	_	None	No pending interrupt	_	
0b0110	1st Highest	Receive Line	Overrun, Parity, Frame	Reading ULSR or empty all	
		Status	Error, Break Interrupt,	the error characters in DMA	
			and FIFO Error (DMA	mode	
			mode only)		

0b0100	2nd	Receive Data	FIFO mode: Trigger	FIFO mode: Reading URBR
	Highest	Ready	threshold was reached	till below trigger threshold.
			Non-FIFO mode: URBR	Non-FIFO mode: Empty
			full	URBR
0b1100	2nd	Receive	FIFO mode only: URBR	Reset receive buffer by
	Highest	Timeout	not empty but no data	setting UFCR.RFRT to 1 or
			read in for a period of time	Reading URBR
0b0010	3rd Highest	Transmit	FIFO mode: Empty	FIFO mode: Data number in
		Data Request	location in UTHR equal to	UTHR more than half
			half or more than half	
			Non-FIFO mode: UTHR	Non-FIFO mode: Writing
			empty	UTHR
0b0000	4th Highest	Modem	Modem CTS_ pin status	Reading UMSR
		Status	change	

24.2.6 UART FIFO Control Register (UFCR)

The write-only register UFCR contains the control bits for receive and transmit FIFO.

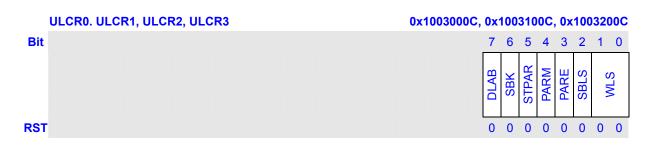

Bits	Name	Description	RW
7:6	RDTR	Receive Buffer Data Number Trigger	
		These bits are used to select the trigger level for the receive data ready	
		interrupt in FIFO mode.	
		0b00 = 1	
		0b01 = 8	
		0b10 = 16	
		0b11 = 24	
5	Reserved	Always read 0, write is ignored	R
4	UME	UART Module Enable	W
		0 = Disable UART	
		1 = Enable UART	
3	DME	DMA Mode Enable	W
		0 = Disable DMA mode	
		1 = Enable DMA mode	
2	TFRT	Transmit Holding Register Reset	W

		0 = Not reset	
		1 = Reset transmit FIFO	
1	RFRT	Receive Buffer Reset	W
		0 = Not reset	
		1 = Reset receive FIFO	
0	FME	FIFO Mode Enable	W
		Set this bit before the trigger levels.	
		0 = non-FIFO mode	
		1 = FIFO mode	

24.2.7 UART Line Control Register (ULCR)

The ULCR defines the format for UART data transmission.

Bits	Name	Description	RW	
7	DLAB	Divisor Latch Access Bit		
		0 = Enable to access URBR, UTHR or UIER		
		1 = Enable to access UDLLR or UDLHR		
6	SBK	Set Break	W	
		Causes a break condition (at least one 0x00 data) to be transmitted to the		
		receiving UART. Acts only on the TXD pin and has no effect on the		
		transmit logic.		
		0 = No effect on TXD output		
		1 = Forces TXD output to 0		
5	STPAR	Sticky Parity	W	
		Setting this bit forces parity location to be opposite of PARM bit when		
		PARE is 1 (it is ignored when PARE is 0).		
		0 = Disable Sticky parity		
		1 = Enable Sticky parity (opposite o f PARM bit)		
4	PARM	Parity Odd/Even Mode Select	W	
		If PARE = 0, PARM is ignored		
		0 = Odd parity		
		1 = Even parity		
3	PARE	Parity Enable	W	
		Enables a parity bit to be generated on transmission or checked on		

		reception.				
		0 = No parity				
		1 = Parity				
2	SBLS	Stop Bit Length Select	W			
		Specifies the number of stop bits transmitted and received in each				
		character. When receiving, the receiver checks only the first stop bit.				
		0 = 1 stop bit				
		1 = 2 stop bits, except for 5-bit character then 1-1/2 bits				
1:0	WLS	Word Length Select	W			
		0b00 = 5-bit character				
		0b01 = 6-bit character				
		0b10 = 7-bit character				
		0b11 = 8-bit character				

24.2.8 UART Line Status Register (ULSR)

The read-only ULSR indicates status information during the data transfer. Receive error information in ULSR[4:1] remains set until software reads ULSR and it must be read before the error character is read.

Bits	Name	Description	RW	
7	FIFOE	FIFO Error Status (FIFO mode only)		
		FIFOE is set when there is at least one kind of receive error (parity,		
		frame, overrun, break) for any of the characters in receive buffer. FIFOE		
		is reset when all error characters are read out of the buffer.		
		During DMA transfer, the error interrupt generates when FIFOE is 1, and no receive DMA request generates even when data in receive buffer reaches the trigger threshold until all the error characters are read out. In non-DMA mode, FIFOE set does not generate error interrupt.		
		0 = No error data in receive buffer or non-FIFO mode		
		1 = One or more error character in receive buffer		
6	TEMP	Transmit Holding Register Empty		
		Set when both UTHR and shift register are empty. It is cleared when		

		either the LITHE or the chiff register contains a data character	
		either the UTHR or the shift register contains a data character.	
		0 = There is data in the transmit shifter and UTHR	
-	TDDO	1 = All the data in the transmit shifter and UTHR has been shifted out	_
5	TDRQ	Transmit Data Request	R
		Set when UTHR has half or more empty location (FIFO mode) or empty	
		(non-FIFO mode).	
		When both UIER.TDRIE and TDRQ are 1, transmit data request interrupt	
		generates or during DMA transfer, DMA request to the DMA controller	
		generates when UIER.TDRIE is 0 and TDRQ is 1.	
		generates when oldin. Finite is a and Finite is 1.	
		0 = There is one (non-FIFO mode) or more than half data (FIFO mode) in	
		UTHR	
		1 = None data (non-FIFO mode) or half or less than half data (FIFO	
		mode) in UTHR	
4	BI	Break Interrupt	R
		BI is set when the received data input is held low for longer than a	
		full-word transmission time (the total time of start bit + data bits + parity	
		bit + stop bits). BI is cleared when the processor reads the ULSR. In	
		FIFO mode, only one character equal to 0x00 is loaded into the FIFO	
		regardless of the length of the break condition. BI shows the break	
		condition for the character at the front of the FIFO, not the most recently	
		received character.	
		0 = No break signal has been received	
		1 = Break signal received	
3	FMER	Framing Error	R
		Set when the bit following the last data bit or parity bit is detected to be 0.	
		If the ULCR had been set for two or one and half stop bits, the other stop	
		bits are not checked except the first one. In FIFO mode, FMER shows a	
		framing error for the character at the front of the receive buffer, not for the	
		most recently received character.	
		Cleared when the processor reads the ULSR.	
		0 = No framing error	
		1 = Invalid stop bit has been detected	
2	PARER	Parity Error	R
		Indicates that the received data character does not have the correct even	
		or odd parity, as selected by the even parity select bit. PARER is set	
		upon detection if a parity error and is cleared when the processor reads	
		the ULSR. In FIFO mode, PARER shows a parity error for the character	
		at the front of the FIFO, not the most recently received character.	
		0 = No parity error	
		1 = Parity error has occurred	
1	OVER	Overrun Error	R

		Set when both receive buffer and shifter are full and new data is received which will be lost.	
		Cleared when the processor reads the ULSR.	
		0 = No data has been lost	
		1 = Receive data has been lost	
0	DRY	Data Ready	R
		Set when a complete incoming character has been received into the	
		Receive Buffer registers. DRY is cleared when the receive buffer is read	
		(non-FIFO mode) or when the buffer is empty or when the buffer is reset	
		by setting UFCR.RFRT to 1.	
		0 = No data has been received	
		1 = Data is available in URBR	

24.2.9 UART Modem Control Register (UMCR)

The UMCR uses the modem control pins RTS_ and CTS_ to control the interface with a modem or data set. UMCR also controls the loopback mode. Loopback mode must be enabled before the UART is enabled.

Bits	Name	Description	RW			
7	MDCE	Modem Control Enable	W			
		0 = Modem function is disabled				
		1 = Modem function is enabled				
6	FCM	Flow Control Mode				
		0 = Flow control by software				
		1 = Flow control by hardware				
5	Reserved	Always read 0, write is ignored				
4	LOOP	Loop Back	W			
		This bit is used for diagnostic testing of the UART. When LOOP is 1, TXD				
		output pin is set to a logic 1 state, RXD is disconnected from the pin, and				
		the output of the transmitter shifter register is looped back into the				
		receiver shift register input internally, similar to CTS_ and RTS_ pins and				
		the RTS bit of the UMCR is connected to CTS bit of UMSR respectively.				
		Loopback mode must be selected before the UART is enabled.				

		0 = Normal operation mode			
		1 = Loopback-mode UART operation			
3	Reserved	Always read 0, write is ignored	R		
2	Reserved	Always read 0, write is ignored			
1	RTS	Request To Send			
		This bit can control the RTS_ output state.			
		0 = RTS_ force to high			
		1 = RTS_ force to low			
0	Reserved	Always read 0, write is ignored	R		

24.2.10 UART Modem Status Register (UMSR)

The read-only UMSR provides the current state of the control lines from the modem to the processor. They are cleared when the processor reads UMSR.

Bits	Name	Description	RW			
7	Reserved	Always read 0, write is ignored	R			
6	Reserved	ways read 0, write is ignored				
5	Reserved	Always read 0, write is ignored	R			
4	CTS	Status of Clear To Send	R			
		When MDCE bit is 1, this bit is the complement of CTS_input. If Loop bit				
		of UMCR is 1, this bit is equivalent to RTS bit of UMCR.				
		0 = CTS_ pin is 1				
		1 = CTS_ pin is 0				
3	Reserved	lways read 0, write is ignored				
2	Reserved	Always read 0, write is ignored	R			
1	Reserved	Always read 0, write is ignored	R			
0	CCTS	Change status of CTS_				
		When MDCE bit is 1, this bit indicates the state change on CTS_ pin.				
		0 = No state change on CTS_ pin since last read of UMSR				
		1 = A change occurs on the state of CTS_ pin				

24.2.11 UART Scratchpad Register

This Scratchpad register is used as a scratch register for the programmer and has no effect on the UART.

24.2.12 Infrared Selection Register (ISR)

The ISR is used to configure the slow-infrared (SIR) interface that is provided in each UART to support two-way wireless communication using infrared transmission that conforms to the IrDA serial infrared specification 1.1. The maximum frequency is up to 115.2kbps.

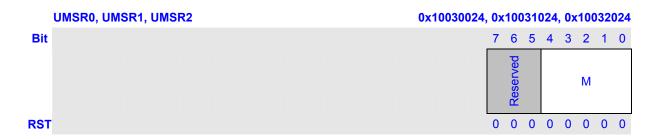

Bits	Name	Description	RW
7:5	Reserved	Always read 0, write is ignored	R
4	RDPL	Receive Data Polarity	W
		0 = Slow-infrared (SIR) interface decoder takes positive pulses as zeros.	
		1 = SIR decoder takes negative pulses as zeros.	
3	TDPL	Transmit Data Polarity	W
		0 = SIR encoder generates a positive pulse for a data bit of zero.	
		1 = SIR encoder generates a negative pulse for a data bit of zero.	
2	XMODE	Transmit Pulse Width Mode	W
		Set when the transmit encoder needs to generate 1.6us pulses (that are	
		3/16 of a bit-time at 115.2 kbps).	
		Cleared when the transmit encoder needs to generate 3/16 of a bit-time	
		wide according to current baud rate.	
		0 = Transmit pulse width is 3/16 of a bit-time wide.	
		1 = Transmit pulse width is 1.6 us.	
1	RCVEIR	Receiver SIR Enable	W
		This bit is used to select the signal from the RXD pin is processed by the	
		IrDA decoder before it is fed to the UART (RCVEIR = 1) or bypass IrDA	
		decoder and is fed directly to the UART (RCVEIR = 0).	

		0 = Receiver is in UART mode.	
		1 = Receiver is in SIR mode.	
0	XMITIR	Transmitter SIR Enable	W
		This bit is used to select TXD output pin is processed by the IrDA	
		encoder before it is fed to the device pin (XMITIR = 1) or bypass IrDA	
		encoder and is fed directly to the device pin (XMITIR = 0).	
		Note: disable infrared LED before XMITIR is set, otherwise a false start	
		bit may occur.	
		0 = Transmitter is in UART mode.	
		1 = Transmitter is in SIR mode.	

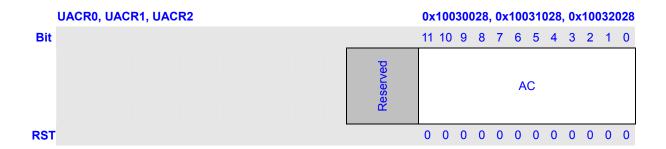

24.2.13 UART M Register (UMR)

M is the value of UMR register.

It will take UART at least M cycles to transmit one bit and receiver to receive one bit, It will take UART at most M+1 cycles for transmitter to transmit one bit and receiver to receive one bit,

24.2.14 UART Add Cycle Register (UACR)

If nth bit of the register is 1, it will take UART M+1 cycles to transmit or receive the bit of date for transmit or receive.

If the register is 12'h0, UART will receive or transmit a bit by M cycle.

If the register is 12'hfff, UART will receive or transmit a bit by M+1 cycle.

For the detail to see 1.3.8For any frequency clock to use the Uart

24.3 Operation

The following sections describe the UART operations that include flow of configuration, data transmission, data reception, and Infrared mode.

24.3.1 UART Configuration

Before UART starts to transfer data or changing transfer format, configuration must be done to define the transfer format. The sample flow is as the following:

In FIFO mode, set FME bit of UFCR to 1, reset receive and transmit FIFO, then initialize the UART as described below.

- 3. Clear UFCR.UME to 0
- 4. Set value in UDLL/UDHR to generate the baud rate clock
- 5. Set data format in ULCR
- 6. If it is in FIFO MODE, set FME bit and other FIFO control in UFCR, reset receive and transmit FIFO, otherwise skip item 4
- 7. Set each interrupt enable bit in UIER in interrupt-based transfer or set UFCR.DME in DMA-based transfer (DMA transfer is FIFO mode only), then set UFCR.UME

24.3.2 Data Transmission

After configuration, UART is ready for data transfer. For data transmission, refer to the following procedure:

- 3. Read ULSR.TDRQ (interrupt disable) or wait for transmit data request interrupt (interrupt enable), if TDRQ = 1 or transmit data request interrupt generates, that means there is enough empty location in UTHR for new data
- 4. If ULSR.TDRQ is 1 or get the transmit data request interrupt, write transmit data to UTHR to start transmission
- 5. Do item 1 and item 2 if there are more data waiting for transmit
- 6. After all necessary data are written to UTHR, wait ULSR.TEMP = 1, that means all data completely transmitted
- 7. If it is necessary to send break, set ULCR.SBK and at least wait for 1-bit interval time to send a valid break, then clear ULCR.SBK
- 8. Clear UME bit to finish UART transmission

24.3.3 Data Reception

After configuration, UART is ready for data transfer. For data reception, refer to the following sample procedure:

- Read ULSR.DRY (interrupt disable) or wait for receive data request interrupt (interrupt enable),
 if ULSR.DRY =1 or receive data request interrupt generates, that means URBR has one data
 (non-FIFO mode) or data in URBR reaches the trigger value (FIFO mode)
- If ULSR.DRY = 1 or receive data request interrupt generates, then read ULSR.FIFOE or see if there is error interrupt, if FIFOE = 1, it means received data has receive error, then go to error handler, other wise go to item 3
- Read one received data in URBR (non-FIFO mode) or data equal to trigger value in URBR (FIFO mode)
- Check whether all data received: check whether ULSR.DRY = 0, in FIFO mode and interrupt is enabled, timeout interrupt may generate, when timeout interrupt generates, read URBR till ULSR.DRY = 0
- Clear UFCR.UME to end data reception when all data are received and ULSR.DRY = 0

24.3.4 Receive Error Handling

A sample error handling flow is as the following:

- If ULSR.FIFOE = 1, it means there is receive error in received data, then check what error it is
- If ULSR.OVER = 1, go to OVER error handling
- If ULSR.BI = 1, go to Break handling
- If ULSR.FMER = 1, go to Frame error handling
- If PARER = 1, go to PARER error handling

24.3.5 Modem Transfer

When UMCR.MDCE = 1, modem control is enabled. Transfer flow can be stopped and restarted by software through RTS_ and CTS_ pin. When UART transmitter detects low level on CTS_ pin, it stops transmission and TxD pin goes to mark state after finishing transmitting the current character until it detects CTS_ pin goes back to high level. RTS_ pin is output to receiving UART and its state can be controlled by setting UMCR.RTS bit, that is, setting UMCR.RTS to 1, RTS_ pin is low level output that means UART is ready to receive data, on the contrary, it means UART currently can't receive more data.

24.3.6 DMA Transfer

UART can operate in DMA-based (UFCR.DME = 1, FIFO mode only), that is, dma request initiated by UART takes the place of interrupt request and transmission/reception is carried out using DMA instead of CPU. Be sure that software guarantee to disable transmit and receive interrupt except timeout and error interrupts.

During DMA transfer, if an interrupt occurs, software must first read the ULSR to see if an error interrupt exists, then check the UIIR for the source of the interrupt and if DMA channel is already halt because of the error indicator from UART, then disable DMA channel and read out all the error data from receive FIFO. Software re-set and re-enable DMA and data transfer by DMA will re-start.

24.3.7 Slow IrDA Asynchronous Interface

Each UART supports slow infra-red (SIR) transmission and reception by setting ISR.XMITIR and ISR.RCVEIR to 1 (make sure the two bits are not set to 1 at the same time because SIR can't operate full-duplex). According to the IrDA 1.1, data rate is limited at a maximum value of 115.2Kbps.

In SIR transmit mode, the transmit pulse comes out at a rate of 3/16 (when the transmit data bit is zero); in SIR receive mode, the receiver must detect the 3/16 pulsed period to recognize a zero value (an active high or low pulse is demodulation to 0, and no pulse is demodulation to 1).

Compared to normal UART, there are some limitations to SIR, that is, each character is fixed to 8-bit data width, no parity and 1 stop bit and modem function is ignored. The IrDA 1.1 specifies a minimum 10ms latency after an optical node ceases transmitting before its receiver recovers its receiving function and software must guarantee this delay.

In the IrDA 1.1 specification, communication must start up at the rate of 9600bps, but then allows the link to negotiate higher (or lower) data rates if supported by both ends. However, the communication rate will not automatically change. Change, if necessary, is performed by software.

24.3.8 For any frequency clock to use the UART

Note: if you don't set M register and UACR the UART work at normal mode with the specified frequencies. To use other frequency you should to set M register and UACR to right value.

1. The Improving

Following changes are made

- One bit is composed by M CLK_{BR} cycles, which can be 4~1024
- Some extra CLK_{BR} cycles can be inserted in some bits in one frame, so that like M has

fraction.

For instance:

$$CLK_{BR} = CLK_{DEV} / N$$
 $N = 1, 2, ...$ $CLK_{BR} = CLK_{DEV} = 4MHz$ Band rate = 460800

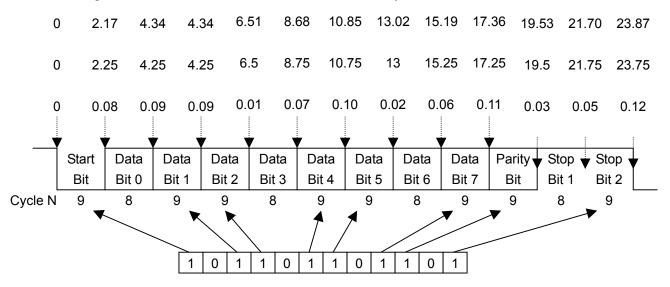

In accurate

 $M_a = 8.681$

We take

M = 8, with 8 extra cycles in every frame

A 12-bit register is used to indicate where to insert the extra cycles

For transmission, in theory, the biggest error is half of CLK_{BR} cycle, which is 0.125us here.

2. To set UMR register

M_a= CLK_{BR}/band rate

M is modem of Mao

Write M to Mregister.

Considering the power and the robust quality, for M form 6 to 32 is you better select by set the UDLR.

The max error

$$\frac{0.5/CLK_{BR}}{M_a/CLK_{BR}} = 0.5/M_a < 0.5/M$$

М	4	8	16	32	64
error/W _{bit}	12.5%	6.25%	3.125%	1.56%	0.78%

3. To set UACR value

For each bit of it means:

0: means not to add additional cycle to the bit that UART is prepare to transmit or receive, in another word, you will to use M cycles to transmit or receive the bit.

1: means to add additional cycle to the bit that UART is prepare to transmit or receive, in another word, you will to use M+1 cycles to transmit or receive the bit.

To set UACR value you must ensure that the max error of each bit should be less than 0.5P_{BR}.

For example: M_a -M =0.15; M+1- M_a =0.85;

Write UMR 8 Write UMR 408

cycle/bit : M, M, M, M+1, M, M, M, M, M, M, M+1, M
UACR : 0 0 0 1 0 0 0 0 0 1 0

25 One-Wire Bus Interface

25.1 Overview

The OWI has the following features:

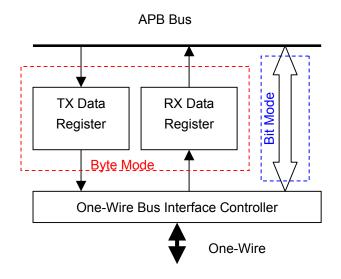

- * Support 1-wire bus protocol.
- * Support Overdrive speed mode and Regular speed mode.
- * Data is transferred with the LSB first.
- * Support bit operate mode and byte operate mode.
- * OWI is the only master on the bus.

25.2 Pin Description

Table 25-1 One-Wire Controller Pins Description

Name	I/O	Description	
OWDAT	Input/Output	One-Wire Data signal.	

25.3 Structure

25.4 Register Description

Table 25-2 OWI Registers Description

Name	Description	RW	Reset Value	Address	Access Size
OWCFG	Configure Register	RW	0x00	0x10072000	8
OWCTL	Control Register	RW	0x00	0x10072004	8
OWSTS	Status Register	RW	0x00	0x10072008	8
OWDAT	Data Register	RW	0x00	0x1007200C	8
OWDIV	Clock Divide Register	RW	0x00	0x10072010	8

25.4.1 One-Wire Configure Register (OWCFG)

OWCFG				0x1	1007	20 0)0
Bit	7	6 5	4	3	2 1	1 (0
	MODE	RDDATA WRDATA	RDST	WR1/RD	WR0	ZS I	ENA
RST	0	0 0	0	0	0 (0	0

Bits	Name	Description	RW
7	MODE	OWI mode select.	RW
		0: Regular speed mode.	
		1: Overdrive speed mode.	
6	RDDATA	Receive a byte from one-wire bus. This bit is cleared when receive data is	RW
		complete. The value of received data is stored in OWDAT, and is valid after	
		RDDATA is self-cleared.	
		0:Do nothing/Receive data is completed.	
		1:Receive data from one-wire bus and stored in OWDAT.	
5	WRDATA	Transmit the data in OWDAT. This bit is cleared when the transmission of data	RW
		is complete.	
		0: Do nothing/Transmission of data completed.	
		1: Transmit the data in OWDAT.	
4	RDST	Read status. This bit is valid after the WR1/RD bit is self-cleared.	R
		0: 0 was sampled during a read.	
		1: 1 was sampled during a read.	
3	WR1/RD	Write 1/ Read. This bit is cleared when the write of the bit is complete.	RW
		The valve of one wire can be read, since the Write 1 and Read timing	
		are identical. The value of the read bit is stored in RDST, and is valid	
		after WR1/RD is self-cleared.	
		0: Do nothing/Write 1 sequence completed.	

		1: Generate Write 1 sequence on line.		
2	WR0	Write 0 on line. This bit is cleared after the presence is determined.	RW	
		0: Do nothing/Write 0 sequence completed.		
		1: Generate Write 0 sequence on line.		
1	RST	Reset presence pulse. This bit is cleared after the presence is	RW	
		determined.		
		0: Do nothing. Reset pulse completed.		
		1: Generate reset pulse and sample slaves presence pulse.		
0	ENA	Enable of OWI operation.	RW	
		1: Write 1 to this bit to enable the OWI operation.		
		0: Write 0 to this bit to disable the OWI operation.		

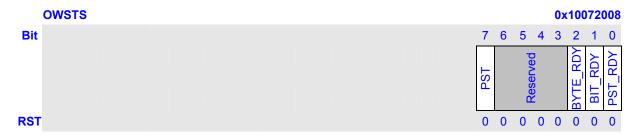

Note: To make the OWI operate normally, only one of the RST, RDDATA, WRDATA, WR1/RD and WR0 is equal to 1.

25.4.2 One-Wire Control Register (OWCTL)

Bits	Name	Description	
7:3	Reserved	These bits always read as 0. Write data to these bits are ignored.	R
2	EBYTE	Enable byte write / read interrupt.	RW
1	EBIT	Enable bit write / read interrupt.	RW
0	ERST	Enable reset sequence finished interrupt.	RW

25.4.3 One-Wire Status Register (OWSTS)

Bits	Name	Description		
7	PST	Whether the 1-wire bus has device or not. This bit is valid after the RST	RW	
		bit is self-cleared.		

		1:The 1-wire bus has device on it.	
		0:The 1-wire bus has no device on it.	
6:3	Reserved	These bits always read as 0. Write data to these bits are ignored.	R
2	BYTE_RDY	Have received or transmitted a data.	RW
1	BIT_RDY	Have received or transmitted a bit.	RW
0	PST_RDY	Have finished a reset pulse.	RW

25.4.4 One-Wire Data Register (OWDAT)

Bits	Name	Description	
7:0	DATA	Store the received data and is valid after RDDATA is self-cleared.	RW
		Prepare the transmission data for transmitting.	

25.4.5 One-Wire Clock Divide Register (OWDIV)

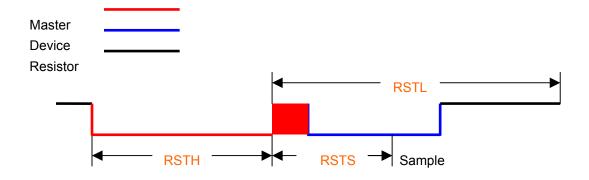

Bits	Name	Description	
7:6	Reserved	These bits always read as 0. Write data to these bits are ignored.	
5:0	CLKDIV	Controls the divider used to create the DEV_CLK based upon the	RW
		CPM_OWI_SYSCLK.	
		When the OWI work in the regular speed mode:	
		1 MHz = DEV_CLK = CPM_OWI_SYSCLK / (CLKDIV + 1).	
		When the OWI work in the overdrive speed mode:	
		4 MHz = DEV_CLK = CPM_OWI_SYSCLK / (CLKDIV + 1).	

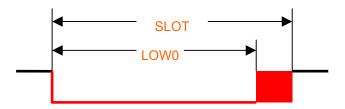

25.5 One-Wire Bus Protocol

25.5.1 Reset Timing and ACK Timing

	RSTH	RSTL	RSTS
Regular Speed mode	512us	512us	68us
Overdrive Speed mode	64us	64us	8us

25.5.2 Write 0 Timing

	SLOT	LOW0
Regular Speed mode	128us	100us
Overdrive Speed mode	16us	12us

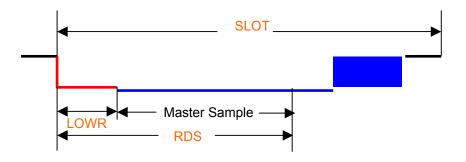

25.5.3 Write 1 Timing

	SLOT	LOW1
Regular Speed mode	128us	5us
Overdrive Speed mode	16us	1.25us

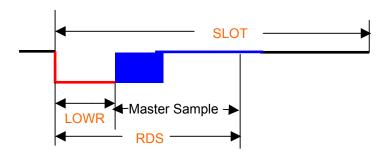

25.5.4 Read0 Timing

	SLOT	LOWR	RDS
Regular Speed mode	128us	5us	13us
Overdrive Speed mode	16us	1.25us	1.75us

25.5.5 Read1 Timing

	SLOT	LOWR	RDS
Regular Speed mode	128us	5us	13us
Overdrive Speed mode	16us	1.25us	1.75us

25.6 One-Wire Operation Guide

1. Interrupt operation guide:

- Write the frequency divider to I2CGR.
- 2 Set OWSTS to clear the flag.
- 3 Set OWCTL to enable the operation interrupt.
- 4 Select OWI mode (Regular speed mode or Overdrive speed mode).
- 5 Set RST, RDDATA, WRDATA, WR1/RD or WR0 to choose one kind of operation.
- 6 Set ENA to enable OWI.
- 7 Wait till the interrupt happened, and the operation is finished.
- If you want to disable OWI when OWI is working, you should set ENA to 0 and till ENA is really set to 0, then you can do next operation.

2. CPU operation guide:

- 1 Write the frequency divider to I2CGR.
- 2 Select OWI mode (Regular speed mode or Overdrive speed mode).
- 3 Set RST, RDDATA, WRDATA, WR1/RD or WR0 to choose one kind of operation.
- 4 Set ENA to enable OWI.
- 5 Wait the ENA is cleared, and the operation is finished.
- 6 If you want to disable OWI when OWI is working, you should set ENA to 0 and till ENA is really set to 0, then you can do next operation.

26 TS Slave Interface (TSSI)

26.1 Overview

The TS Slave Interface (TSSI) in this processor is used to connect DTV Demodulator. It supports MPEG-2 Transport Stream (TS) as its input.

Features:

- Support both parallel mode and serial mode for TS data transfer.
- TSDI0 or TSDI7 can be used to transfer data in serial mode.
- The order of data in one byte supports LSB at first or MSB at first.
- The order of data in one word supports LSB at first or MSB at first.
- Input control signals and data can be either active high or active low.
- Support using either positive or negative edge of TSCLK.
- Support PID filtering function.
- Up to 17 PID filters can be used when PID filtering function is enabled.

26.2 Pin Description

Table 26-1 TSSI Pin Description

Name	I/O	Description
TSDI0~7	I	TS data bus
TSFAIL	1	TS packet uncorrectable
TSCLK	1	TS clock
TSFRM	1	TS data valid
TSSTR	I	TS packet start

26.3 Register Description

In this section, we will describe the registers in TSSI. Following table lists all the register definitions. All registers' 32bit addresses are physical addresses. And detailed function of each register will be described below.

Table 26-2 TSSI Register Description

Name	Description	RW	Reset Value	Address	Access Size
TSENA	TSSI Enable Register	RW	0x00	0x10073000	8
TSCFG	TSSI Configure Register	RW	0x00FF	0x10073004	16
TSCTRL	TSSI Control Register	RW	0x03	0x10073008	8
TSSTAT	TSSI State Register	RW	0x00	0x1007300C	8
TSFIFO	TSSI FIFO Register	R	0x???????	0x10073010	32
TSPEN	TSSI PID Enable Register	RW	0x80000000	0x10073014	32
TSPID0	TSSI PID Filter Register 0	RW	0x00000000	0x10073020	32
TSPID1	TSSI PID Filter Register 1	RW	0x00000000	0x10073024	32
TSPID2	TSSI PID Filter Register 2	RW	0x00000000	0x10073028	32
TSPID3	TSSI PID Filter Register 3	RW	0x00000000	0x1007302C	32
TSPID4	TSSI PID Filter Register 4	RW	0x00000000	0x10073030	32
TSPID5	TSSI PID Filter Register 5	RW	0x00000000	0x10073034	32
TSPID6	TSSI PID Filter Register 6	RW	0x00000000	0x10073038	32
TSPID7	TSSI PID Filter Register 7	RW	0x00000000	0x1007303C	32

26.3.1 TSSI Enable Register (TSENA)

The register TSENA is used to trigger TSSI to work.

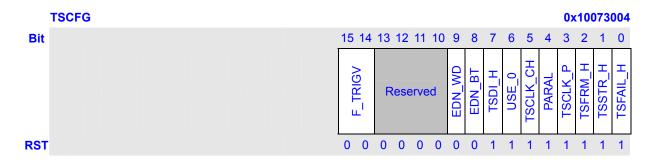

Bits	Name	Description	RW
7	SFT_RST	TSSI FIFO software-reset. Set it to 1 and later it will be cleared by	RW
		hardware auto.	
		0: Stop reset	
		1: Start reset	
6:3	Reserved	These bits always read 0, and writing operations are ignored.	R

2	PID_EN	Enable / disenable the PID filtering function.	RW
		0: PID filtering function is not enabled	
		1: PID filtering function is enabled	
1	DMA_EN	Enable / disenable the DMA mode.	RW
		0: DMA mode is not enabled (CPU only)	
		1: DMA mode is enabled	
0	ENA	Enable / disenable the TSSI module.	RW
		0: TSSI is not enabled	
		1: TSSI is enabled	

26.3.2 TSSI Configure Register (TSCFG)

The register TSCFG is used to configure the TSSI.

Bits	Name		Description	RW		
15:14	F_TRIGV	Specify the trigger	r value of FIFO.	RW		
		F_TRIGV	Description			
		0	Trigger Value is 4			
		1	Trigger Value is 8			
		2	Trigger Value is 16			
		3	Reserved			
13:10	Reserved	These bits always	read 0, and writing operations are ignored.	R		
9	EDN_WD*1	The order of data	he order of data in word.			
8	EDN_BT*1	The order of data	in byte.	RW		
7	TSDI_H	Choose the polari	ty of TSDI0~7.	RW		
		0: TSDI0~7 is acti	ve low			
		1: TSDI0~7 is acti	ve high			
6	USE_0	USE_0 is only use	ed in SERIAL mode (TSCFG.PARAL=0).	RW		
		0: Use TSDI7 to tr	ransfer data			
		1: Use TSDI0 to tr	ransfer data			
5	TSCLK_CH	Choose how to us	se TSCLK.	RW		
		0: When f _{pclk} > 3f _{TS}	SCLK			
		1: When f _{pclk} > 2f _{Ts}	SCLK			

4	PARAL	Choose the working mode of TSSI.	RW
		0: Serial Mode	
		1: Parallel Mode	
3	TSCLK_P	This bit is used to determine which edge of TSCLK is used when TSSI	RW
		is sampling data.	
		0: Use the negative edge of TSCLK	
		1: Use the positive edge of TSCLK	
2	TSFRM_H	Choose the polarity of TSFRM.	RW
		0: TSFRM is active low	
		1: TSFRM is active high	
1	TSSTR_H	Choose the polarity of TSSTR.	RW
		0: TSSTR is active low	
		1: TSSTR is active high	
0	TSFAIL_H	Choose the polarity of TSFAIL.	RW
		0: TSFAIL is active low	
		1: TSFAIL is active high	

Note*1: END_BT and END_WD in register TSCFG.

	Byte0 Bit0-7	Byte1 Bit0-7	Byte2 Bit0-7	Byte3 Bit0-7	Byte4 Bit0-7	Byte5 Bit0-7	Byte6 Bit0-7	Byte7 Bit0-7
		END_W	D=0	Byte0	Byte1	Byte2	Byte3	
		_		Byte4	Byte5	Byte6	Byte7	
		END W	D=1	Byte3	Byte2	Byte1	Byte0	
		_		Byte7	Byte6	Byte5	Byte4	
END_BT=0	Bit0	Bit1	Bit2	Bit3	Bit4	Bit5	Bit6	Bit7
END_BT=1	Bit7	Bit6	Bit5	Bit4	Bit3	Bit2	Bit1	Bit0

26.3.3 TSSI Control Register (TSCTRL)

The register TSCTRL is used to control TSSI to work.

	TSCTRL					0 x	100	730	800
Bit		7	6	5	4	3	2	1	0

Bits	Name	Description	RW
7:2	Reserved	These bits always read 0, and writing operations are ignored.	R
1	F_OVRNM	FIFO overrun interrupt mask.	RW
		0: enabled	
		1: masked	
0	F_TRIGM	FIFO trigger interrupt mask.	RW
		0: enabled	
		1: masked	

26.3.4 TSSI State Register (TSSTAT)

The register TSSTAT is used to keep the state of TSSI.

Bits	Name	Description	RW
7:2	Reserved	These bits always read 0, and writing operations are ignored.	R
1	F_OVRN	FIFO overrun interrupt flag.	RW
		1: active	
		0: not active	
0	F_TRIG	FIFO trigger interrupt flag.	R
		1: active	
		0: not active	

26.3.5 TSSI FIFO Register (TSFIFO)

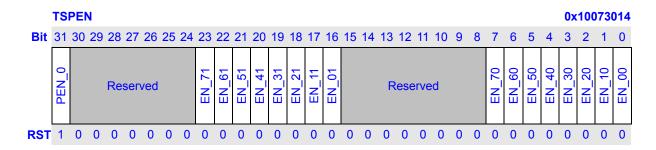

The register TSFIFO is corresponded to TSSI FIFO.

26.3.6 TSSI PID Enable Register (TSPEN)

The register TSPEN is used to control the PID filtering.

Bits	Name	Description	RW
31	PEN_0	Choose PID filter enable for PID=0.	RW
		0: not enable	
		1: enable	
30:24	Reserved	These bits always read 0, and writing operations are ignored.	R
23:16	EN_x1	PID filter enable for TSPIDx.PID1.	RW
	(x=7~0)	0: not enable	
		1: enable	
15:8	Reserved	These bits always read 0, and writing operations are ignored.	R
7:0	EN_x0	PID filter enable for TSPIDx.PID0.	RW
	(x=7~0)	0: not enable	
		1: enable	

26.3.7 TSSI PID Filter Registers (TSPID0~7)

The registers TSPID0~7 are used to store PID values that need to be filtered from MPEG-2 TS.

	TS	PID	0~7	•																					0x1	100	730	20-	-0x	100	730	3C
Bit	31	30	29	28	27	26	25	24	23	22 2	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PID1										Reserved							F	PIDO)												
RST	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bits Name Description RW	Bits	Name	Description	RW
--------------------------------	------	------	-------------	----

31:29	Reserved	These bits always read 0, and writing operations are ignored.	R
28:16	PID1	Set the PID value that needs to be filtered.	RW
15:13	Reserved	These bits always read 0, and writing operations are ignored.	R
12:0	PID0	Set the PID value that needs to be filtered.	RW

26.4 TSSI Timing

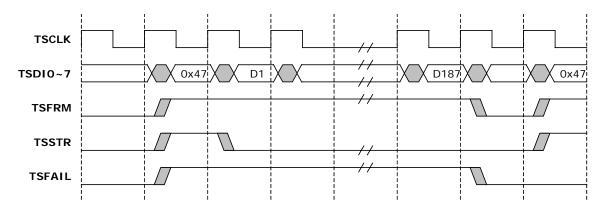

Figure 26-1 Timing waveform in parallel mode

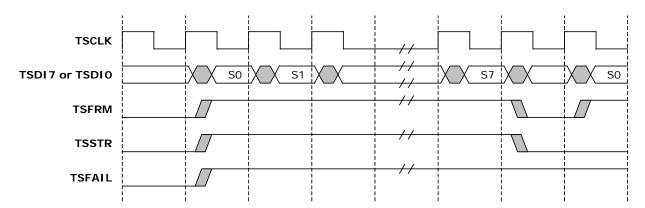

Figure 26-2 Timing waveform in serial mode

26.5 TSSI Guide

26.5.1 TSSI Operation without PID Filtering Function

- 1. Set TSCTRL to 0x03 to mask all interrupts.
- 2. Set TSCFG to choose the working mode of TSSI and the trigger value of FIFO.
- 3. Set TSENA.PID EN to 0 to turn off the PID filtering function.
- 4. Set TSENA.DMA EN to 1 or 0 to decide whether to use the DMA mode or not.
- 5. Write 0x00 to TSSTAT clear all interrupt flag.
- 6. Set TSCTRL to 0x00 to enable all interrupts.
- 7. Set TSENA.ENA to 1 to turn on TSSI module.

26.5.2 TSSI Operation with PID Filtering Function

- 1. Set TSCTRL to 0x03 to mask all interrupts.
- 2. Set TSCFG to choose the working mode of TSSI and the trigger value of FIFO.
- 3. Set TSENA.PID_EN to 1 to turn on the PID filtering function.
- 4. Set TSENA.DMA_EN to 1 or 0 to decide whether to use the DMA mode or not.
- 5. Write 0x00 to TSSTAT clear all interrupt flag.
- 6. Set TSCTRL to 0x00 to enable all interrupts.
- 7. Set TSENA.ENA to 1 to turn on TSSI module.
- 8. Change TSPID registers and then set TSPID to enable the PID filter.
- When PID in TS package is equal to the valve in TSPID register, the TS package will be get.

27 Image Process Unit

27.1 Overview

IPU (Image process unit) contains Resize and CSC (color space conversion), which is used for image post processing

27.1.1 Feature

- 1. Location: AHB bus
- 2. Input format:
- -- Separate frame: YUV /YCbCr (4:2:0, 4:2:2, 4:4:4, 4:1:1), RGB
- -- Packaged data: YUV422
- 3. Output data format:
- -- RGB (565, 555, 888)
- -- Packaged data YUV422
- 4. Color convention coefficient: configurable (CSC enable)
- 5. Minimum input image size (pixel): 2x2
- 6. Maximum input image size (pixel): 4095x4095
- 7. Maximum output image size (pixel):
- -- Width: up to 4095 (with no vertical resizing)
 - up to 800 (with vertical resizing)
- --Height: up to 4095
- 8. Image resizing:
- -- Up scaling ratios up to 1:2 in fractional steps with 1/32 accuracy
- -- Down scaling ratios up to 32:1 in fractional steps with 1/32 accuracy

^{*}For more details, refer to Appendix

27.1.2 Block

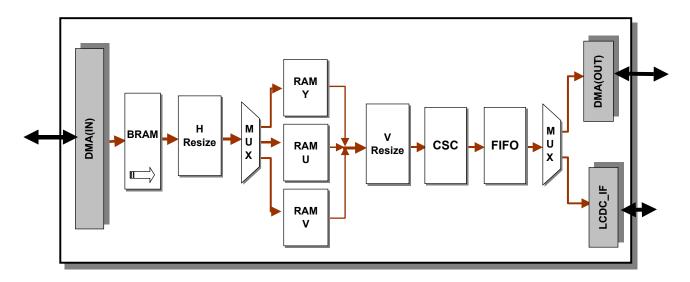

Figure 1.2 The Block about the IPU

27.2 Data flow

27.2.1 Input data

- Separated YUV (or YcbCr/RGB; the following use YUV for convenience) Frame case: Y, U, V data would be fetched from external memory by DMA burst read operation.
- Packaged YUV422 case: Packaged YUV data would be fetched from external memory by DMA burst read operation.

27.2.2 Output data

- DMA output to external memory case: The output data format could be RGB (565, 555, 888) or YUV (package), and the data would be stored to the external memory by DMA burst write operation.
- 2. Flow into LCDC case: The output data format can be RGB or YUV (package), and the transfer would not cross AHB BUS.

27.2.3 Resize Coefficients LUT

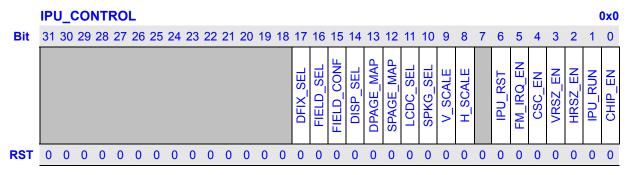

The resize coefficients look up table is preset by software according to specific format (see <u>27.3.23</u>, <u>27.3.24</u>, <u>27.3.24.1</u> for detail). There are 2 tables support independent horizontal and vertical scaling. Each table has 32 entries that can accommodate up to 32 coefficients.

27.3 Registers Descriptions

The physical address base for the address-mapped registers of IPU is **0x13080000**.

27.3.1 IPU Control Register

Bits	Name	Description	R/W
31:18	Reserved	Writing has no effect, read as zero.	R
17	DFIX_SEL	Fixed destination address choose	RW
		(valid when LCDC_SEL == 0):	
		0: not use the fixed address	
		1: use the fixed address	
16	FIELD_SEL *1	Destination field choose:	RW
		(valid when FIELD_CONF_EN == 1)	
		0: top field	
		1: bottom field	
15	FIELD_CONF_EN *1	Destination field display configure enable:	W
		0: do not change IPU field display	
		1: re-configure field	
		read as zero	
14	DISP_SEL	Destination display choose:	RW
		0: frame display mode	
		1: field display mode	
13	DPAGE_MAP	Destination address page mapping choose:	RW
		0: not use the page mapping	
		1: use the page mapping	
12	SPAGE_MAP	Source address page mapping choose:	RW
		0: not use the page mapping	
		1: use the page mapping	
11	LCDC_SEL	Output data destination choose:	RW
		0: output to external memory	
		1: output to LCDC FIFO	
10	SPKG_SEL	Input data case choose:	RW
		0: Separated YUV Frame	
		1: Packaged YUV422	

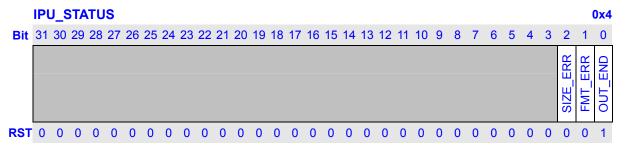

9	V_SCALE	Vertical direction scale flag.	RW
		0: down scaling; 1: up scaling	
8	H_SCALE	Horizontal direction scale flag.	RW
		0: down scaling;	
		1: up scaling	
7	Reserved	Writing has no effect, read as zero.	R
6	IPU_RST *2	Reset IPU. Writing 1: reset IPU; 0: no effect.	W
		Read as zero	
5	FM_IRQ_EN	Frame process finish interrupt enable.	RW
		1: enable; 0: disable	
4	CSC_EN	CSC enable. 1: enable; 0: disable	RW
3	VRSZ_EN	Vertical Resize enable. 1: enable; 0: disable	RW
2	HRSZ_EN	Horizontal Resize enable. 1: enable; 0: disable	RW
1	IPU_RUN	Run the IPU 1: run	RW
0	CHIP_EN	IPU chip enable. 1: enable; 0: disable	RW

NOTES:

- *1. The FIELD_SEL will work when the DISP_ SEL is 1, which indicates the IPU is under the field display mode. And the IPU will output the picture from the initial field (top or bottom) to the next field (bottom or top) automatically. The initial field can be configured by setting the FIELD_SEL to 0 or 1 with FIELD_CONF_EN is 1. The FIELD_CONF_EN is just the trigger that controls the FIELD SEL valuation.
- *2. Setting 1 to IPU_RST will reset all software visible IPU registers except the CHIP_EN immediately.

27.3.2 IPU Status Register

Bits	Name	Description	R/W
31:2	Reserved	Writing has no effect, read as zero.	R
2	SIZE_ERR	The size error flag: 1: size error; 0: size ok	R
1	FMT_ERR	IPU format error flag. 1: format error; 0: format OK	R
0	OUT_END	Output termination flag. 1: finished; 0: not finished	R/W

NOTES:

1. If IPU_CONTROL.FM_IRQ_EN has been set 1, once OUT_END is set value 1 which denotes a frame's post process done, an low level active interrupt request will be issued until

corresponding software handler read IPU_STATUS and clean end flag.

- 2. When the IPU_CONTROL.FM_LCDC_SEL has been set 1, and the IPU has finished one transfer, the LCDC and CPU need to occupy the IPU control. The IPU will **monitor** the request signal from **LCDC** (hardware signal) and the read signal from the **CPU** (polling end flag), then it will determine whether re-configure itself by the CPU if the CPU read first or output the same frame to LCDC again if the LCDC get the control. Once the LCDC has occupied the IPU, the OUT_END will **turn to 0** and IPU will **restart again**, automatically. And if the CPU has occupied the IPU, the OUT_END will **not** turn to 0 except the CPU clean it and IPU will **not** restart again except the CPU run it.
- 3. When the IPU_CONTROL.FM_LCDC_SEL has been set 1, the IPU will output the result data to LCDC directly. Under this condition, the user must be careful when change the IPU parameters, as the LCDC will be under run easily. When turn on the mode that IPU output data to LCDC directly, user **must** run the IPU **first**, and **then** turn on the LCDC. And when need to turn off this mode, user **must** turn off the data channel between IPU and LCDC by turn off the parameter in **LCDC** first and then polling the end flag of IPU to occupy the control to IPU.

27.3.3 Data Format Register

	D _	FΜ	Т																												C	8x
Bit	31	30	29	28 2	27	26	25	24	23	22	21	20 1	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
								RGB_888	RGB OUT	ı Lii		OUT_FMT	I	VIIV PKG	THO THO	001 _OFT													E3O N	IN OF I	FMH	1
RST	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bits	Name	Description	R/W
31:25	Reserved	Writing has no effect, read as zero.	R
24	RGB_888_	RGB888 output format indicator (only used in RGB888 out)	RW
	OUT_FMT	0: the low 24 bits will be the pixel in a word	
		1: the high 24 bits will be the pixel in a word	
23:21	RGB_OUT_	Output data packaged offset (only used in RGB out)	RW
	OFT	000: RGB	
		001: RBG	
		010: GBR	
		011: GRB	
		100: BRG	
		101: BGR	
		Others: reserved	
20:19	OUT_FMT	Indicates the destination data format:	RW
		00: RGB555	
		01: RGB565	
		10: RGB888	

		11: YUV422 package	
18:16	YUV_PKG_	Output data packaged offset (only used in CSC disable	RW
	OUT_OFT	case and in the YUV422 packaged case)	
		000: Y ₁ UY ₀ V	
		001: Y ₁ VY ₀ U	
		010: UY1VY0	
		011: VY1UY0	
		100: Y ₀ UY ₁ V	
		101: Y ₀ VY ₁ U	
		110: UY ₀ VY ₁	
		111: VY ₀ UY ₁	
15: 4	Reserved	Writing has no effect, read as zero.	R
3:2	IN_OFT	Input data packaged offset (only used in YUV422 packaged	RW
		case)	
		00: Y₁UY₀V	
		01: Y₁VY₀U	
		10: UY ₁ VY ₀	
		11: VY ₁ UY ₀	
1:0	IN_FMT	Indicates the source data format:	RW
		00: YUV 4:2:0	
		01: YUV 4:2:2	
		10: YUV 4:4:4	
		11: YUV 4:1:1	

27.3.4 Input Y Data Address Register

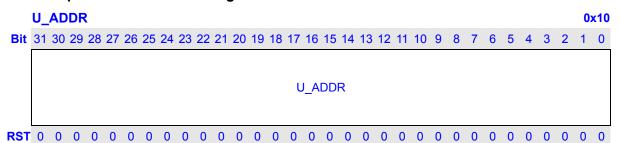

Bits	Name	Description	R/W
31:0	Y_ADDR *1	In separated Frame case, it indicates the source	RW
		Y data buffer's start address.	
		In YUV422 package case, it indicates the start	
		address of the packaged Frame.	

NOTE:

- 1. When the IPU_CONTROL.SPAGE_MAP == 1, the Y_ADDR should be the **low 12** bits of the start virtual address.
- 2. Y_ADDR should be word align.

27.3.5 Input U Data Address Register

Bits	Name	Description	R/W
31:0	U_ADDR *1	The source U data buffer's start address of	RW
		separated frame case.	

NOTE:

- 1. When the IPU_CONTROL.SPAGE_MAP == 1, the U_ADDR should be the **low 12** bits of the start virtual address.
- 2. U ADDR should be word align.

27.3.6 Input V Data Address Register

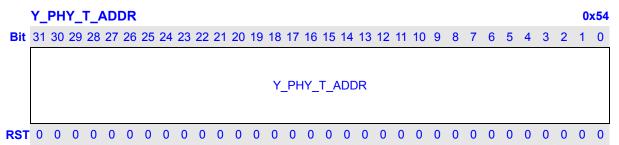

Bits	Name	Description	R/W
31:0	V_ADDR	The source V data buffer's start address of separated	RW
		Frame case.	

NOTE:

- 1. When the IPU_CONTROL.SPAGE_MAP == 1, the V_ADDR should be the **low 12** bits of the start virtual address.
- 2. V_ADDR should be word align.

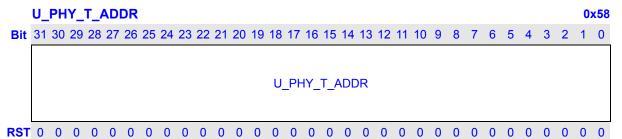

27.3.7 Input Y physics table address

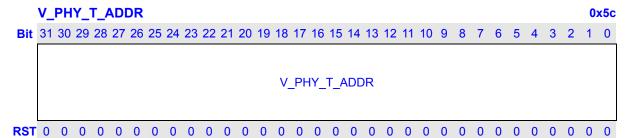

Bits	Name	Description	R/W
31:0	Y_PHY_T_	The start address of the physics-mapping table about the Y	RW
	ADDR	data. (This register will act when the IPU_CONTROL.PAGE_MAP is	
		valid)	

27.3.8 Input U physics table address

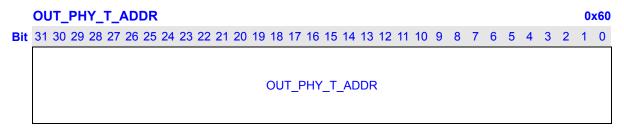

Bits	Name	Description	R/W
31:0	U_PHY_T_	The start address of the physics-mapping table about the U	RW
	ADDR	data. (This register will work when the IPU_CONTROL.PAGE_MAP	
		is valid)	

27.3.9 Input V physics table address

Bits	Name	Description	R/W
31:0	V_PHY_T_	The start address of the physics mapping table about the V	RW
	ADDR	data (This register will work when the IPU_CONTROL.PAGE_MAP	
		is valid)	

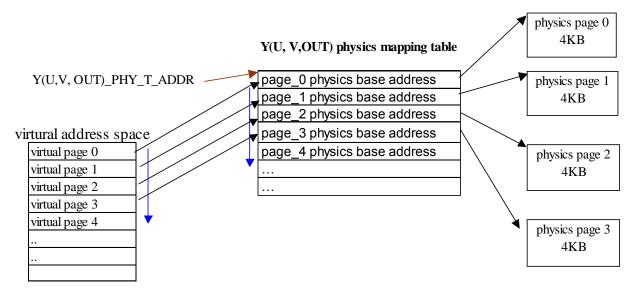

27.3.10 OUT physics table address

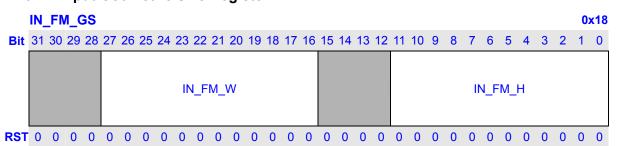

Bits	Name	Description	R/W
31:0	OUT_PHY_T_	The start address of the physics mapping table about the	RW
	ADDR	data which will be DMA out (This register will work when the	
		IPU_CONTROL.PAGE_MAP is valid)	

27.3.10.1 ADDRESS Mapping

The Y (U, V, OUT)_PHY_T_ADDR should store the **base address** of the Y (U, V, OUT) physics-mapping table. In the Y (U, V, OUT) physics-mapping table, it should contain different physics page base address, and the physics page must be 4KB align.

27.3.11 Input Geometric Size Register

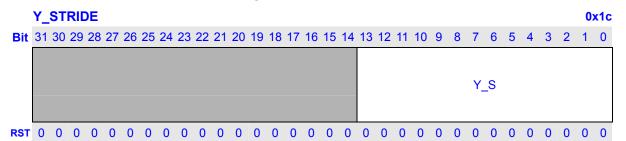

Bits	Name	Description	R/W
31:28	Reserved	Writing has no effect, read as zero.	R
27:16	IN_FM_W	The width of the input frame (unit: byte). Y data width is the	
		same as this value while U/V or Cb/Cr data width should do	
		relatively zoom in according to the source data format. And	RW
		in the package pattern, this value should be the Y data	
		width also.	

15:12	Reserved	Writing has no effect, read as zero.	R
11:0	IN_FM_H	The height of the input frame (unit: byte). Y data width is	
		same as this value while U/V or Cb/Cr data width should do	RW
		relatively zoom in according to the source data format.	

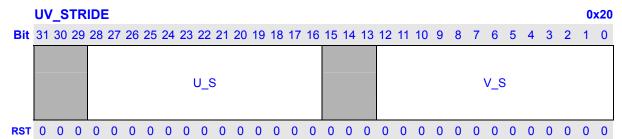

27.3.12 Input Y Data Line Stride Register

Bits	Name	Description	R/W
31:14	Reserved	Writing has no effect, read as zero.	R
13:0	Y_S	The line stride of the source Y data in the external memory	
		of separated Frame case or packaged YUV Frame stride.	RW
		(Unit: byte)	

^{*}Note: Y_S should be world align.

27.3.13 Input UV Data Line Stride Register

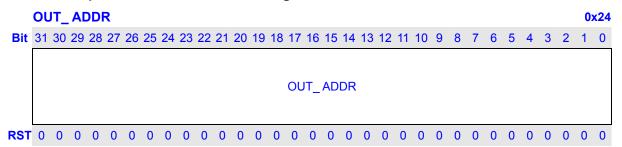

Bits	Name	Description	R/W
31:29	Reserved	Writing has no effect, read as zero.	R
28:16	U_S	The line stride of the source U data in the external memory. (Unit: byte)	RW
15:13	Reserved	Writing has no effect, read as zero.	R
12:0	V_S	The line stride of the source V data in the external memory. (Unit: byte)	RW

^{*}Note: U_S and V_S should be word align.

27.3.14 Output Frame Start Address Register

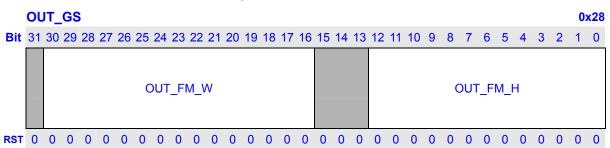

Bits	Name	Description	R/W
31:0	OUT_ADDR *1	The output buffer's start address.	RW

NOTE: *1. When the IPU_CONTROL.DPAGE_MAP == 1, the OUT_ADDR should be the low 12 bits of the start virtual address.

2. it should be word align.

27.3.15 Output Geometric Size Register

Bits	Name	Description	R/W
31	Reserved	Writing has no effect, read as zero.	R
30:16	OUT_FM_W	The width of the output destination frame (unit: byte).	RW
15:13	Reserved	Writing has no effect, read as zero.	R
12:0	OUT_FM_H	The height of the output destination frame (unit: byte).	RW

Note:

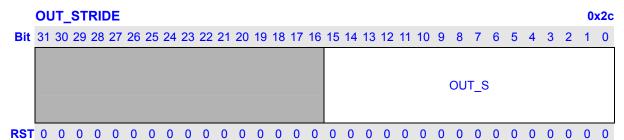

- 1. In the **package** out pattern, the OUT_FM_W should be the **pixel number** in a line.
- 2. In the **RGB** out pattern, the OUT_FM_W should be the **data space** width in the RAM.
- 3. In the out package pattern, the OUT_FM_W should better be even number, else IPU will fill the last Y pixel result with the last second Y pixel automatically.

For example: when the OUT_FM_W is an odd number (A), and the result will be like that: Y0, U, Y0, V

And when the OUT_FM_W is an even number (A+1), and the result is Y1, U, Y0, V

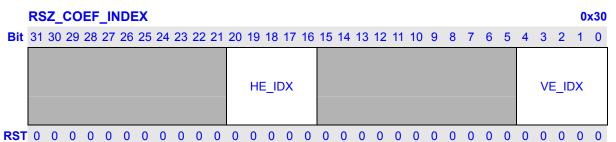

27.3.16 Output Data Line Stride Register

Bits	Name	Description	R/W
31:16	Reserved	Writing has no effect, read as zero.	R
15:0	OUT_S	The line stride of the destination data buffer in the external	RW
		memory. (Unit: byte)	1744

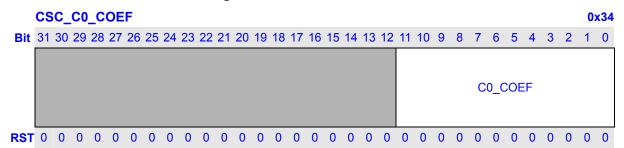

27.3.17 Resize Coefficients Table Index Register

Bits	Name	Description	R/W
31:21	Reserved	Writing has no effect, read as zero.	R
20:16	HE_IDX *1	Indicates the end address of the horizontal resize look up table.	RW
15:5	Reserved	Writing has no effect, read as zero.	R
4:0	VE_IDX *1	Indicates the end address of the vertical resize look up table.	RW

Note: The HE_IDX (VE_IDX) should be the depth of the horizontal (vertical) resize look up table **minus 1**.

27.3.18 CSC C0 Coefficient Register

Bits	Name	Description	R/W
31:12	Reserved	Writing has no effect, read as zero.	R
11:0	C0_COEF	The C0 coefficient of the YUV/YCbCr to RGB conversion.	RW
		C0_COEF = [C0 * 1024 + 0.5]	RVV

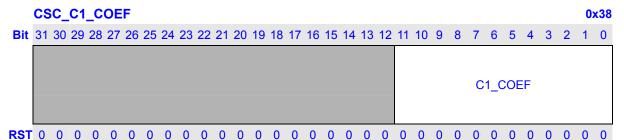

Note:

 $R = C0*(Y - LUMA_OF) + C1*(Cr-CHROM_OF)$

 $G = C0*(Y - LUMA_OF) - C2*(Cb-CHROM_OF) - C3*(Cr-CHROM_OF)$

 $B = C0*(Y - LUMA_OF) + C4*(Cb-CHROM_OF)$

27.3.19 CSC C1 Coefficient Register

Bits	Name	Description	R/W
31:12	Reserved	Writing has no effect, read as zero.	R
11:0	C1_COEF	The C1 coefficient of the YUV/YCbCr to RGB conversion.	RW
		C1_COFF = [C1 * 1024 + 0.5]	ΚVV

Note:

 $R = C0*(Y - LUMA_OF) + C1*(Cr-CHROM_OF)$

 $G = C0*(Y - LUMA_OF) - C2*(Cb-CHROM_OF) - C3*(Cr-CHROM_OF)$

 $B = C0*(Y - LUMA_OF) + C4*(Cb-CHROM_OF)$

27.3.20 CSC C2 Coefficient Register

Bits	Name	Description	R/W
31:12	Reserved	Writing has no effect, read as zero.	R
11:0	C2_COEF	The C2 coefficient of the YUV/YCbCr to RGB conversion.	RW
		C2_COEF = [C2 * 1024 + 0.5]	KVV

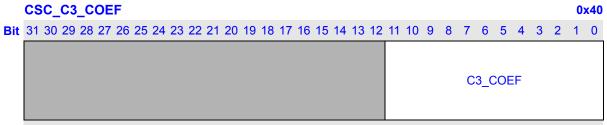

Note:

 $R = C0*(Y - LUMA_OF) + C1*(Cr-CHROM_OF)$

 $G = C0*(Y - LUMA_OF) - C2*(Cb-CHROM_OF) - C3*(Cr-CHROM_OF)$

 $B = C0*(Y - LUMA_OF) + C4*(Cb-CHROM_OF)$

27.3.21 CSC C3 Coefficient Register

Bits	Name	Description	R/W
31:12	Reserved	Writing has no effect, read as zero.	R
11:0	C3_COEF	The C3 coefficient of the YUV/YCbCr to RGB conversion.	RW
		C3 COEF = [C3 * 1024 + 0.5]	LAA

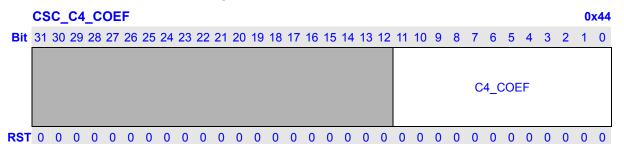

Note:

 $R = C0*(Y - LUMA_OF) + C1*(Cr-CHROM_OF)$

 $G = C0*(Y - LUMA_OF) - C2*(Cb-CHROM_OF) - C3*(Cr-CHROM_OF)$

 $B = C0*(Y - LUMA_OF) + C4*(Cb-CHROM_OF)$

27.3.22 CSC C4 Coefficient Register

Bits	Name	Description	R/W
31:12	Reserved	Writing has no effect, read as zero.	R
11:0	C4_COEF	The C4 coefficient of the YUV/YCbCr to RGB conversion.	RW
		C4_COEF = [C4 * 1024 + 0.5]	KVV

Note:

 $R = C0*(Y - LUMA_OF) + C1*(Cr-CHROM_OF)$

 $G = C0*(Y - LUMA_OF) - C2*(Cb-CHROM_OF) - C3*(Cr-CHROM_OF)$

 $B = C0*(Y - LUMA_OF) + C4*(Cb-CHROM_OF)$

27.3.23 Horizontal Resize Coefficients Look Up Table Register group

Bits	Name	Description	R/W
31:13	Reserved	Writing has no effect, read as zero.	R
12	START	This bit will indicate the horizontal coefficient writing start. The IPU will reset the entire horizontal coefficient and waiting the new coefficient writing	
11:2	W_COEF	Weighting coefficients, 10 bits length, that is to say the precision is 1/512. For up-scaling, $W_k = 1 - (k^*n/m - [k^*n/m]), k = 0, 1, \dots m-1.$ For down-scaling, for $(t=0, k=0; k < n; k++)$ { If $([(t^*n+1)/m] - k >=1)$ { $W_k = 0;$ } else if $((t^*n+1)/m - k ==0)$ { $W_k = 1; t++;$ } else { $W_k = 1 - ((t^*n+1)/m - [t^*n/m]); t++;$ } } $W_COEF_k = [512 * W_k] \text{ (stands for get the rounding integer, } [20.33] = 20 \text{ while } [20.66] = 21)$ Here n stands for original pixel points, m stands for pixel points after resize. For example down-scaling 5:3, $n = 5, m = 3$. Moreover, m and n are prime, that is, for example 8:2 should be converted to 4:1. When IPU_CONTROL.RSZ_EN set as 1 and m:n = 1:1, all coefficients should be calculated as up-scale case.	W
1	IN_EN	Flag for whether new pixel would be used. IN_EN = 0, no new pixel IN_EN = 1, one new pixel In down scale case, IN_EN always equals 1. In up scale case, For (i=0, k=0; k < m; k++) { If(i<= k*n/m) { IN_EN k = 1; i++;} else { IN_EN k = 0;} }	RW

RW

NOTES:

The coefficient number equals to max (m, n). HLUT (horizontal look up table) and VLUT (vertical look up table) are independent, so the two tables may have different coefficient number. Therefore.

RSZ_COEF_INDEX.VIDX = The coefficient number of VLUT – 1
RSZ_COEF_INDEX.HIDX = The coefficient number of HLUT – 1

Moreover, when m=1 for down-scaling, discard above formula and use following rules:

- 1. $W_COEF_0 = 256 (W_0 = 0.5)$, and $W_COEF_{1 \sim n-1} = 0$
- 2. IN_EN always equals 1
- 3. OUT_EN₀ = 1, and OUT_EN_{1 ~ n-1} = 0

Following are two examples of setting LUT

Resize coefficients for 7:3

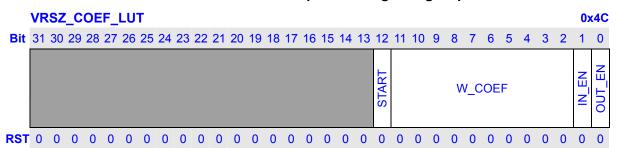

W	W_COE	IN_EN	OUT_EN	Pixel	Pixel	OUT
	F			1	2	
2/3	341	1	1	P [0]	P [1]	P [0] * 2/3 + P [1] * 1/3
0	0	1	0	P [1]	P [2]	No new pixel out
1/3	171	1	1	P [2]	P [3]	P [2] * 1/3 + P [3] * 2/3
0	0	1	0	P [3]	P [4]	No new pixel out
0	0	1	0	P [4]	P [5]	No new pixel out
1	512	1	1	P [5]	P [6]	P [5] * 1 + P [6] * 0
0	0	1	0	P [6]	P [7]	No new pixel out

Resize coefficients for 3:5

W	W_COE	IN_EN	OUT_EN	Pixel	Pixel	OUT
	F			1	2	
1	512	1	1	P [0]	P [1]	P [0] * 1 + P [1] * 0
2/5	205	0	1	P [0]	P [1]	P [0] * 2/5 + P [1] * 3/5
4/5	410	1	1	P [1]	P [2]	P [1] * 4/5 + P [2] * 1/5
1/5	102	0	1	P [1]	P [2]	P [1] * 1/5 + P [2] * 4/5
3/5	307	1	1	P [2]	P [3]	P [2] * 3/5 + P [3] * 2/5

27.3.24 Vertical Resize Coefficients Look Up Table Register group

^{*}Function descriptions are same as horizontal LUT.

27.3.24.1 Calculation for Resized width and height

For software, to preset correct value for register OUT GS, please refer to following formula.

Set IW stand for original input frame width, IH stand for original input frame height, OW stand for new frame width after resize, OH stand for new frame height after resize.

In Up-scale case (n < m):

```
If [(IW - 1) * (m/n)] * (n/m) ==(IW-1) then

OW = [(IW - 1) * (m/n)] + 1;

Else OW = [(IW - 1) * (m/n)] + 2;

If [(IH - 1) * (m/n)] * (n/m) == (IH-1) then

OH = [(IH - 1) * (m/n)] + 1;

Else OH = [(IH - 1) * (m/n)] + 2;

In Down-scale case (n>m):

If [(IW - 1) * (m/n)] * (n/m) ==(IW-1) then

OW = [(IW - 1) * (m/n)];

Else OW = [(IW - 1) * (m/n)] + 1;

If [(IH - 1) * (m/n)] * (n/m) ==(IH-1) then

OH = [(IH - 1) * (m/n)];

Else OH = [(IH - 1) * (m/n)] + 1;
```

For example:

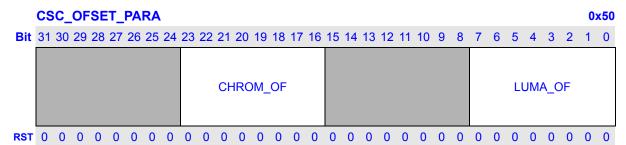

A 36x46 frame with the horizontal resize ratio of 4:5 (up-scale) and vertical resize ratio of 7:6 (down-scale), by the expressions above we get its new size after resize from the following process.

For Width:
$$[(36 - 1) * (5/4)] * (4/5) = 34.4 \neq (36-1)$$

So OW = $[(36 - 1) * (5/4)] + 2 = 45$
For Height: $[(46 - 1) * (6/7)] * (7/6) = 44.33 \neq (46 - 1)$
So OH = $[(46 - 1) * (6/7)] + 1 = 39$

27.3.25 CSC Offset Parameter Register

Bits	Name	Description	R/W
31:24	Reserved	Writing has no effect, read as zero.	R
23:16	CHROM_OF	Chroma offset value	RW
15:8	Reserved	Writing has no effect, read as zero.	R
7:0	LUMA_OF	Luma offset value	RW

Note:

 $R = C0*(Y - LUMA_OF) + C1*(Cr-CHROM_OF)$

 $G = C0*(Y - LUMA_OF) - C2*(Cb-CHROM_OF) - C3*(Cr-CHROM_OF)$

 $B = C0*(Y - LUMA_OF) + C4*(Cb-CHROM_OF)$

27.4 IPU Operation Flow

27.4.1 CONTROL SET

Step No.	Action	Register	Note
Base	Enable IPU Chip (IPU_CONTROL)	CHIP_EN	
0	Read the END flag and do the next steps (IPU_STATUS)	Wait (END == 1)	Here you can also clean the END flag, but for low power consumer, we do not commend this.
1	Set IPU primary control (IPU_CONTROL)	VRSZ_EN HRSZ_EN CSC_EN IRQ_EN	For saving power, when there is no vertical or horizontal resize, disable it
2	Set IPU source data control (IPU_CONTROL)	Source data package SPKG_SEL Source address mapping SPAGE_MAP	
3	Set IPU destination data control (IPU_CONTROL)	Output data destination LCDC_SELDestination address mapping DPAGE_MAPDestination display mode DISP_ SEL Initial field select FIELD_SEL	
4	Set scale flag (IPU_CONTROL)	V_SCALE H_SCALE	

27.4.2 FORMAT SET

Step No.	Action	Register	Note
5	Set IPU frame format (D_FMT)	Source data format IN_FMT	It just works when the source is not package (IPU_CONTROL.SPKG_SEL =0)
		Input data packaged offset IN_OFT	It just works when the source is package (IPU_CONTROL.SPKG_SEL =1)
		Output data packaged offset YUV_PKG_OUT_OFT	Only used in CSC disable case and in the packaged case
		Destination data format OUT_FMT	
		Output data packaged offset RGB_OUT_OFT	Only used in RGB output case
		RGB888 out format RGB_888_OUT_FMT	Only used in RGB 888 output case

27.4.3 INPUT FRAME INFORMATION SET

Step No.	Action	Register	Note
6	Set input frame size	Input frame width	In the package
	(IN_FM_GS)	IN_FM_W	pattern, this value
			should be the Y data
			width also.
		 Input frame height IN_FM_H	
7	Set input frame stride	Y frame stride Y_STRIDE.Y_S U frame stride UV_STRIDE.U_S V frame stride UV_STRIDE.V_S	

8	Set input data start address	Y frame start address	In the address
J	oot input data start address	Y_ADDR	mapping mode, the
		U frame start address	address should be
		U_ADDR	the low 12 bits of the
		V frame start address	first virtual base
		V_ADDR	address

27.4.4 OUTPUT FRAME INFORMATION SET

Step No.	Action	Register	Note
9	Set output frame size:	Output frame width	In the out
	(OUT_GS)	OUT_FM_W	package pattern,
			the OUT_FM_W
			should better be
			even number
		Output frame height	
		OUT_FM_H	
10	Set output frame stride	Output frame stride	
		OUT_STRIDE	
11	Set output data start	Output frame start address	In the address
	address	OUT_ADDR	mapping mode, the
			address should be
			the low 12 bits of the
			virtual base address

27.4.5 ADDRESS MAPPING SET

Step No.	Action	Register	Note
12	Set the start address of the	Y_PHY_T_ADDR	It just works when
	address mapping table for	U_PHY_T_ADDR	the source
	source address	V_PHY_T_ADDR	address mapping
13	Set the start address of the address mapping table for destination address	OUT_PHY_T_ADDR	It just works when the output address mapping

27.4.6 CSC SET

Step No.	Action	Register	Note
14	Set CSC coefficients:	CSC_C0_COEF	It just works when
		CSC_C1_COEF	CSC is enable
		CSC_C2_COEF	
		CSC_C3_COEF	
		CSC_C4_COEF	
15	Set CSC offset (CSC_OFSET_PARA)	LUMA_OF CHROM_OF	It just works when CSC is enable

27.4.7 RESIZE TABLE SET

Step No.	Action	Register	Note
16	Set resize coefficients table index register RSZ_COEF_INDEX	Vertical LUT VE_IDX Horizontal LUT HE_IDX	The HE_IDX (VE_IDX) should be the depth of the horizontal (vertical) resize look up table minus 1
17	Start vertical direction look-up set VRSZ_COEF_LUT	START =1	Before initial the VRST LUT, this step is necessary
18	Set Vertical direction Look-Up Table: VRSZ_COEF_LUT	VRSZ_COEF_LUT	
19 *	Start horizontal direction look-up set HRSZ_COEF_LUT	START =1	Before initial the HRST LUT, this step is necessary
20	Set Horizontal direction Look-Up Table: HRSZ_COEF_LUT	HRSZ_COEF_LUT	

27.4.8 RUN IPU && WAIT END

```
21 Clean_end_flag and RUN IPU Clean_end_flag();
Start_ipu()

Next picture operation again
```

27.5 Operation example

Table 5.1 no mapping mode

Step	Action
Base	Chip_enable()
0	Do { } while {!polling_end_flag}
1	set_primary_ctrl(VRSZ_ENABLE, HRSZ_ENABLE, CSC_EN, irq_en); //
2	set_source_ctrl(source_pkg_sel, SPAGE_SEL);
3	set_out_ctrl(lcdc_sel, DPAGE_SEL, DISP_SEL, FIELD_SEL, FIELD_CONF_EN);

A4. Output data package format (RGB order)

A5. Source Data storing format in external memory (separated YUV Frame)

Example: YUV420 118x80 frame

Note: 1. Every line's start address should be word aligned.

- 2. All pixel data should be stored as little-endian format.
- Destination data (RGB) storing format in external memory is similar with above figure, but RGB555
 and RGB565 frame's every line start address can be half-word aligned (RGB888 frame still need
 word aligned).

28 IDCT

28.1 Overview

MIDCT_4X4 module performs the 4X4 IDCT (DCT) transform. It will be located on the AHB bus.

- 1. Input and output data: 4x4 matrix.
- 2. Support DCT and IDCT transform: HAMA (DCT, IDCT), H264 (DCT, IDCT), REAL (IDCT), and WMV (IDCT).
- 3. Support single IDCT (DCT) transforms or sequential IDCT (DCT) transforms.
- 4. Support access to TCSM

28.1.1 Block

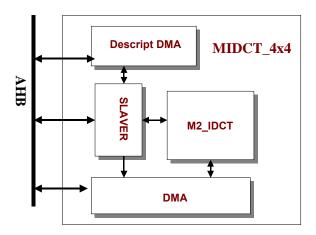

figure 1.1 the Block about the MIDCT_4x4

28.1.2 Fundamental

When the MIDCT_4X4 is enabled, the MIDCT_4X4 can be started by the programmer to do the 4x4 DCT or IDCT transform to one or some 4x4 data block.

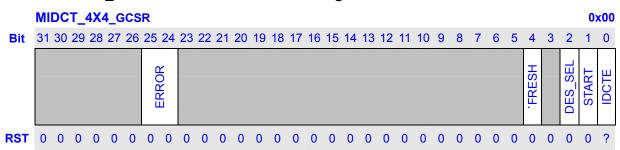

The outside needs to configure the necessary register to the MIDCT_4X4 before start new transforms. The MIDCT_4X4 will run on different modes, which is decided by some parameters. When all the transform has finished, the END flag(MIDCT_4X4_END) will be asserted high.

28.2 Registers Descriptions

The physical address base for the address-mapped registers of MIDCT is 0x130c0000.

28.2.1 MIDCT_4X4 Globe control and status register

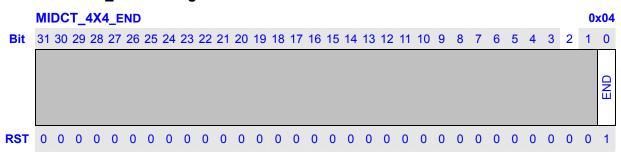

Bits	Name	Description	R/W
31:26	RESERVE	Can not write and read it is 0	R
25:24	ERROR	The error status: (can be reset by the FRESH)	R
		00: reserved	
		01: not support the configure video with the type	
23:5	RESERVE	Can not write and read it is 0	R
4	FRESH	1: reset the entire module	R/W
3	RESERVE	Can not write and read it is 0	R
2	DESP_	Select the IDCT run mode:	R/W
	SEL	0: signal IDCT transfer mode	
		1: descript IDCT transfer mode	
1	START	Start the IDCT transform	R/W
0	IDCTE	Global 4x4 IDCT enable. 0⇔disable; 1⇔enable (can not be reset	R/W
		by the FRESH)	

NOTE: The **MIDCT_4X4_GCSR** cannot be configured by the descript node. It only can be configured by the software.

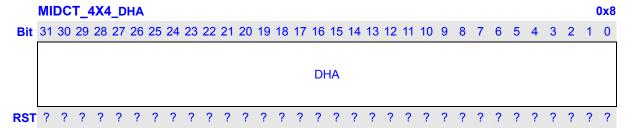

28.2.2 MIDCT_4X4 end register

Bits	Name	Description	R/W
31:1	RESERVE	Can not write and read it is 0	R
0	END	The IDCT transfer end flag. 1: End	R/W
		When the DESP_SEL is 1, it will be 1 when all the IDCT transforms	
		which has been configured in the descript chain has finished. And	
		when the DESP_SEL is 0, it will be 1 when one IDCT transform has	
		finished.	
		Programmer only can write it to 0.	

When the END is high, it means the IDCT is free now and the IDCT can do the next transform again.

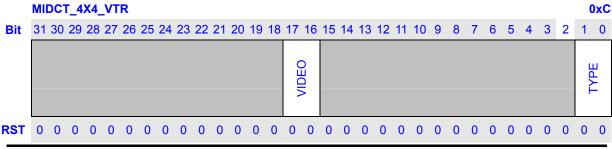

28.2.3 MIDCT_4X4 Descriptor Head Address (DHA)

Bits	Name	Description	RW
31:0	DHA	Descriptor Head Address (word align && can not be read)	W

NOTE: The **MIDCT_4X4_DHA** cannot be configured by the descript dma. It only can be configured by the software when the MIDCT_4X4_GCSR.DESP_SEL is 1.

28.2.4 MIDCT_4X4 video and type Register

Bits	Name	Description	R/W
31:22	RESERVE	Can not write and read it is 0	R
17:16	VIDEO	Configure the video format (can not be reset by the FRESH) 00: HAMA 01: H264 10: REAL 11: WMV	R/W
15:2	RESERVE	Can not write and read it is 0	R
1:0	TYPE	Indicate different IDCT or DCT transform in different video (can not be reset by the FRESH)	R/W

NOTES:

- 1. The MIDCT_4X4_VTR can be configured by the software in the single transform mode and by the descript-DMA in the sequential mode.
- 2. A transform begins with the assertion of the START and end with that all the result data has been sent to the configured address space, which is indicated by the MIDCT_4X4_OUT_ADDR.
- 3. When the END is 1, the programmers need to clean the MIDCT_4X4_GCSR.END to 0 and then can re-configure the MIDCT_4X4 again and restart a new IDCT transform again.
- 4. The following table shows the IDCT or DCT transform with different VIDEO and different TYPE in CodeC

Video	TYPE	Function name in C
00(HAMA)	00	Hama_dct
	01	Hama_idct
01(H264)	00	H264_DCT
	01	ff_h264_idct_add_c
	10	ff_h264_lowres_idct_add_c
10/DEAL)	00	C. Introdevice Transform Ava
10(REAL)	00	C_Intra16x16ITransform4x4
	01	C_ITransform4x4
11(WMV)	00	vc1_inv_trans_4x4_c

Others value is reserved, and the user set other value, the ERROR will be set to 01

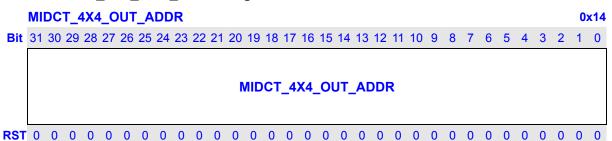

28.2.5 MIDCT_4X4_INPUT_ADDR Register

31:0 INPUT_ADDR The source data base address which should WORLD align R/W

NOTE: The **MIDCT_4X4_INPUT_ADDR** can be configured by the software in the single transform mode and by the descript DMA in the sequential mode.

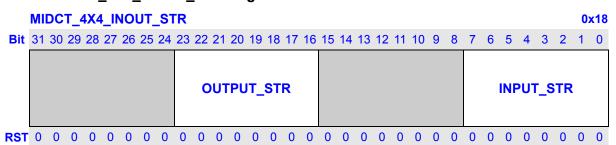

28.2.6 MIDCT_4X4_OUT_ADDR Register

BitsNameDescriptionR/W31:0OUT_ADDRThe 4x4 transform result data store base address which should WORLD alignR/W

NOTE: The **MIDCT_4X4_OUT_ADDR** can be configured by the software in the single transform mode and by the descript DMA in the sequential mode.

28.2.7 MIDCT_4X4_INOUT_STR Register

Bits	Name	Description	R/W
31:24	RESERVE		
23:16	OUTPUT_STR	The line stride of the result data (4x4) (half-word align) (unit:	R/W
		byte)	
15:8	RESERVE		
7:0	INPUT_STR	The line stride of the source data (4x4) (half-Word align) (unit: byte)	R/W

28.3 DATA format

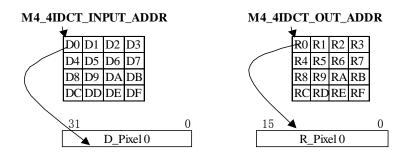

figure 4.1 Data format in REAL case

The above figure shows the format about the data in REAL case. In this case a world is a pixel in the input and a half-word is a pixel in the output.

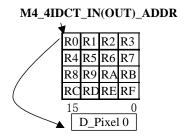

figure 4.2 other case

And the figure 5.2 shows the format about the DCT transform result. In this case the result pixel is 16 bits wide. This case will happen in the HAMA, H264, and WMV case with IDCT result, or in the HAMA and H264 DCT transform.

28.4 Descript Mode

IDCT can run in descript chain mode. In this mode, user can make the IDCT finish serial IDCT operation by descript chain on the AHB1 space.

28.4.1 Link structure

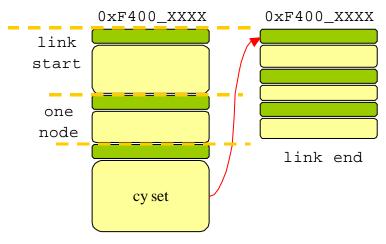

Figure 5.1 Discontinue address space link

In the descript chain each nod contains two parts. One is the node header and the other is node data. The node header will tell IDCT about the current node data information such as the node length, node type, whether it is the last node in the chain and so on. And the node data part will contain the IDCT control information that tells IDCT where to fetch the source data, how to operate the data, and where indicate the result data and so on.

28.4.2 Node header

Word order	Bit	Name	Function
0 th	31	CMD	0:invalid command
			1:next two word is command for ddma
	30~0	Reserved	
1th	31~24	CSA	Downward config start address,
	23	Reserved	
	22-16	DTC ¹	Transfer Counter, 1-word unit
	15~7	Reserved	
	6	ND_DN	The IDCT will auto start once IDCT transfer in this node:
			1: auto start
			0: not auto start
			NOTE: usually this bit should be set 1 except some condition, for
			detail please refer to Address node
	5~4	ND_TYPE	Current node body type.

		00: Data node
		01: Offset node
		10: Address node
		11: Reserved
3	ND_HSK	Does next node do not handshake with host module?
		0: next node do not need handshake
		1: need handshake.
2	ND_CKG ³	Cock gating mode
		0: besides end_flag, ddma also participates gating
		1: gating only by end_flag
		— : software deassert, ddma assert.
		When CKG clear, even current node is end of link, ddma would
		pend for Actv from host module.
1	ND_CY ³	Cycle Chain, return to DHA
0	ND_LINK	Indicator, if there are more nodes

Note:

- At most 127 config word data, not including 1-word head. If offset explained, it takes up 254 words space
- 2. Caution when enter cycle chain. If CY set, DHA isn't change, dmac enter a chain link forever. But with subtle configuration, set cy chain and also change dha value of ddma, next node transfer would start from dha address. So the configuration data don't need to store at the continuous memory space.
- 3. There are two link end at one link now. One for config end, the other for ddma end

28.4.3 Node Type

A. Offset node

This node is consistent with elder version IDCT. Every following configured data is company with one offset address. High 24bit of offset word is mask value to protect bit position of the configuring data; low 8bit of offset word is address of the configuring data in host module. The node type must be consistent with the ND_TYPE in Header.

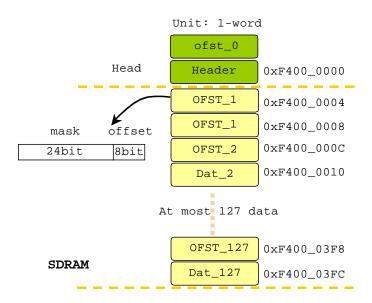

Figure 5.2 offset node structure

B. Data node

In this node, DMA in IDCT would generate offset address continues start from MIDCT_4x4_CSA, downward to Header.CSA-Header.DTC*4.

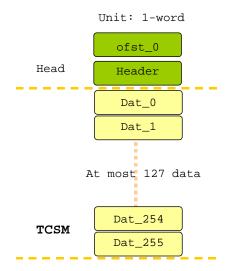

Figure 5.3 without offset node structure

C. Address node

In this node, DMA in IDCT would SINGLE transfer every data as its company address

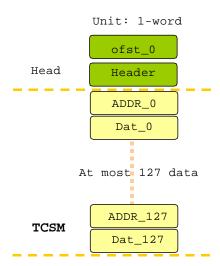

Figure 28.4 Address node

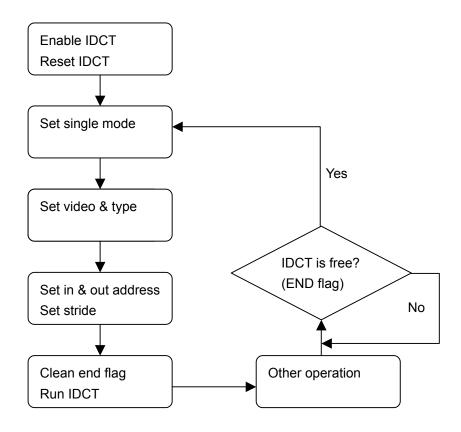

Note: In the address node, the user can control the IDCT write some data to configurable address in descript chain. If the Header. ND_DN has been set to 1 in one node, after each node has been read by IDCT, the IDCT will do once IDCT transform automatically. So if the user just needs the IDCT write a fixed data to an address in the chain, it has two ways.

- 1. It can keep the Header. ND_DN to be 1 and configure the address and data. That is all. In this way the user must be clear that in this node, the IDCT will do an IDCT transform which using the last node parameters if in this node hasn't configured the control content to IDCT.
- 2. It can change the Header. ND_DN to be 0 and configure the address and data. In this way the IDCT will not do the IDCT transform after read the node. But the end flag(MIDCT_4X4_END) will not be pull up. So in this way, the user should try to use this way as less as possible. And if it must to use the way, it's necessary to use this in the last node of a chain and write a flag value to a configured address to indicate the end. And the user can polling the configured end address to know whether the IDCT has finished a chain and can restart it.

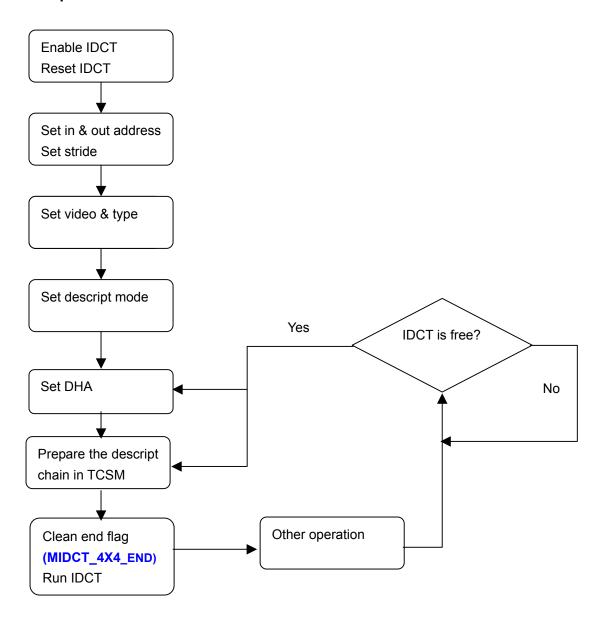

28.5 Operation flow

28.5.1 Single Mode

28.5.2 Descript Mode

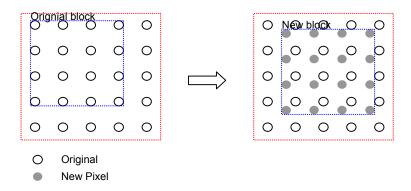

29 Motion Compensation

29.1 Overview

MC (Motion Compensation) is a hard block designed for pixel interpolation during motion compensation of MPEG-1/2/4, H.263/H.264, WMV1, WMV2, VC-1, RV8 and RV9 decoding process. It has independent DMA route, furthermore a special 8K Cache is embedded for reference frame data's fetching efficiency promotion so that before each P/B frame's beginning decoding which should be flushed by SW.

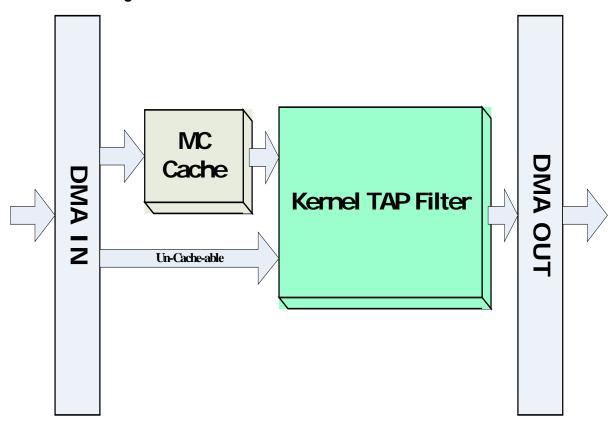

29.1.1 Features

- Input data: reference frame data from external memory; descriptor-chain data from on-chip memory (TCSM)
- Output data: reconstructed data write back to on-chip memory (TCSM)
- Processing format:
 - -- Half-pixel interpolation
 - -- MPEG-4 8-tap Quarter-pixel interpolation
 - --H.264 6-tap Quarter-pixel interpolation
 - -- Eighth-pixel (H.264 chroma, VC-1 chroma) interpolation
 - --WMV2 4-tap Quarter-pixel interpolation
 - -- VC-1 4-tap Quarter-pixel interpolation
 - --RV8 4-tap Third-pixel interpolation
 - --RV8 Chroma interpolation (2-tap Third-pixel)
 - -- RV9 6-tap Quarter-pixel interpolation
 - --RV9 Chroma interpolation (2-tap Quarter-pixel)
- Processing block size: 2x2, 2x4, 4x2, 4x4, 4x8, 8x4, 8x8, 8x16, 16x8, 16x16

29.1.2 Block Diagram

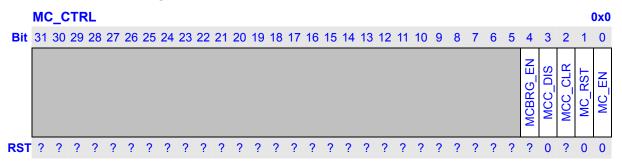

29.2 Register definition

The physical address base for the address-mapped registers of MC is 0x13090000.

29.2.1 MC Control Register

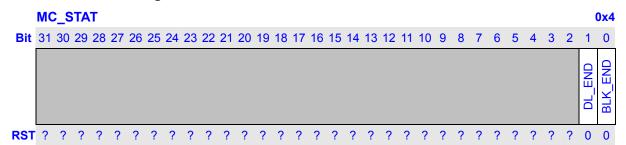

Bits	Name	Description	R/W	
31:5	Reserved	Writing has no effect, read as zero.	R	
4	MCBRG_EN	MC access external memory via appropriative bridge (set 1 to		
		this bit) or general bridge (set 0 to this bit).		
3	MCC_DIS	MC Cache disable, set 1 to disable DMA input data's passing		
		MC Cache. It is only used and must be used when MC is used		
		for fixed address buffer data's copying, so in common		
		interpolation use, this bit should never be set.		
2	MCC_CLR	MC Cache Clear.	W	
		When this bit is set, MC cache clear its set tag and after each		
		tag's clearing this bit is automatic cleared by MC itself, that is to		
		say this bit is non-eyeable to SW.		
1	MC_RST	Reset MC. Writing 1: reset MC; 0: no effect. Read as zero	W	
0	MC_EN	MC enable 1: enable; 0: disable	RW	
		Once MC enabled, MC works until flag OUT_END in the		
		MC_STAT is set with value 1. Also, when MC_EN is set after		
		MCC_CLR, MC would not start working immediately but wait		
		until MC Cache Clear done.		

NOTES:

Setting value 1 to MC_RST will reset all software visible MC registers immediately. It is not recommended that stopping MC abruptly by clearing MC_EN when MC is running (MC_EN=1, OUT_END=0), or writing value 1 to MC_RST when DMA (in or out) is working (MC_EN=1, OUT_END=0), otherwise, the result is unpredictable.

29.2.2 MC Status Register

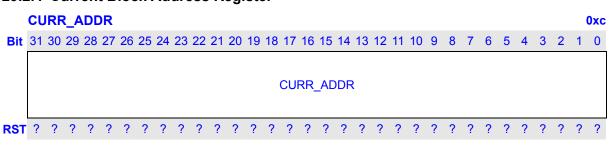

Bits	Name	Description	R/W
31:2	Reserved	Writing has no effect, read as zero.	R
1	DL_END	Descriptor line ending flag. 1: finished; 0: not finished When descriptor-DMA is used (several block's interpolation	
		done by MC automatically), this bit is only set by MC till last	
		block's finishing interpolation, so SW must read out this bit to	
		do sync with MC. It needs be cleared by SW or descriptor-DMA	
		before MC next time's starting.	
0	BLK_END	Block interpolation ending flag. 1: finished; 0: not finished	R/W
		Either descriptor-DMA is used or not used, this bit would be set	
		as soon as a block's interpolation done. HW can only set value	
		1, so it needs be cleared by SW or descriptor-DMA before MC	
		next time's starting. If MC_CTRL.MC_EN is set, SW clear	
		BLK END, MC will run automatically.	

29.2.3 Reference Block Address Register

BitsNameDescriptionR/W31:0REF ADDRReference block start addressRW

29.2.4 Current Block Address Register

Bits	Name	Description	R/W
31:0	CURR_ADDR	Current block's start address.	RW
		Requirements: it can be half-word aligned in case of 2 pixel	
		width block, otherwise, it must be word-aligned.	

29.2.5 Block Information Register

- ◆ WMV2 QPEL: 4x4, 4x8, 8x4, 8x16, 16x8, 16x16

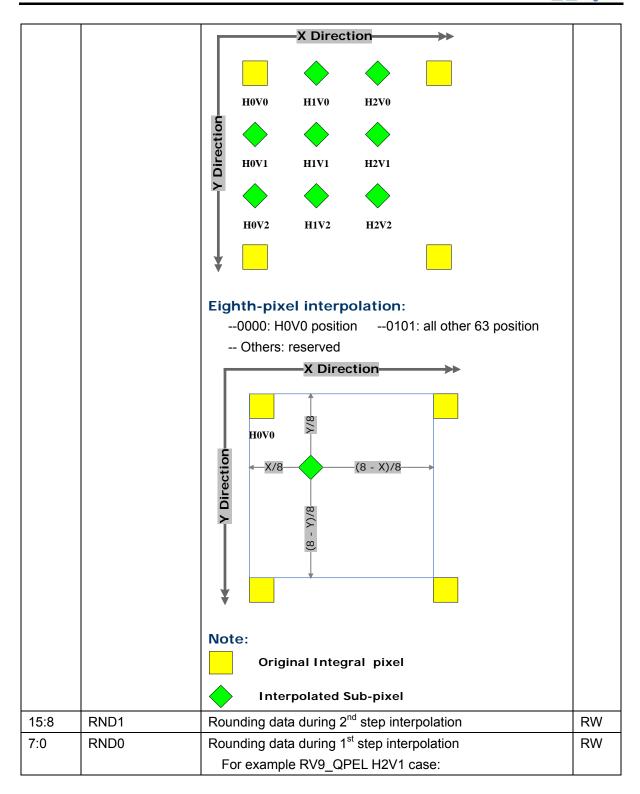

29.2.6 Interpolation Information Register

Bits	Name	Description	R/W						
31:21	Reserved	Writing has no effect, read as zero.	R						
20	IRND	Interpolation AVG rounding disable. (Interpolation AVG means	RW						
		AVG from integral pixel to half-pixel or from half-pixel to							
		quarter-pixel, it's an information decoded from the decoder)							
		For example: MPEG-HPEL interpolation							
		IRND = 0:							
		HPEL pixel = (integral pixel0 + integral pixel1 + 1)/2							
		IRND = 1:							
		HPEL pixel = (integral pixel0 + integral pixel1)/2							
19:16	ITP_CASE	It indicates the interpolated sub-pixels' positions, while its	RW						
		value has the different significances in distinct interpolation							
		types.							
		Half-pixel interpolation:							
		0000: H0V00010: H2V0							
		1000: H0V21010: H2V2							
		Others: reserved							

	It is obvious that they are equivalent. Here RND0 = 16; RND1 = 0.	
--	--	--

29.2.7 Frame Stride Register

Bits	Name	Description	R/W
31:28	Reserved	Writing has no effect, read as zero.	R
27:16	CURR_STRD	Reconstruction buffer's stride in on-chip memory. (Unit: byte)	RW
15:12	Reserved	Writing has no effect, read as zero.	R
11:0	REF_STRD	Reference frame's stride in the external memory. (Unit: byte)	RW

29.2.8 TAP Filter Coefficient Register

Bits	Name	Description	R/W
31:24	TAP_COEF4	4 th tap coefficient	RW
23:16	TAP_COEF3	3 rd tap coefficient	RW
15:8	TAP_COEF2	2 nd tap coefficient	RW
7:0	TAP_COEF1	1 st tap coefficient	RW

STEP1_COEF_REG2

Bit 31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0

TAP_COEF8

TAP_COEF7

TAP_COEF6

TAP_COEF5

TAP_COEF5

Bits	Name	Description	R/W
31:24	TAP_COEF8	8 th tap coefficient	RW
23:16	TAP_COEF7	7 th tap coefficient	RW
15:8	TAP_COEF6	6 th tap coefficient	RW
7:0	TAP_COEF5	5 th tap coefficient	RW

STEP2_COEF_REG1 Step 2_Coef_Reg1 Step 2_Coef_R

Bits	Name	Description	R/W
31:24	TAP_COEF4	4 th tap coefficient	RW
23:16	TAP_COEF3	3 rd tap coefficient	RW
15:8	TAP_COEF2	2 nd tap coefficient	RW
7:0	TAP_COEF1	1 st tap coefficient	RW

	STEP2_COEF_REG2 0x2														28																	
Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

RST	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?

Bits	Name	Description	R/W
31:24	TAP_COEF8	8 th tap coefficient	RW
23:16	TAP_COEF7	7 th tap coefficient	RW
15:8	TAP_COEF6	6 th tap coefficient	RW
7:0	TAP_COEF5	5 th tap coefficient	RW

Note:

- Be careful, STEP1_COEF_REG1 ~ STEP2_COEF_REG2's address are not orderly due to MC descriptor-DMA data mode efficiency consideration, more details please reference to the following text abut MC descriptor-DMA.
- 2. In MC up to 8-tap filter is supported, for example RV9_QPEL H2V1 case as shown above: First step (horizontal interpolation):

```
AA = (1*A1 + (-5)*A2 + 20*A3 + 20*A4 + (-5)*A5 + 1*A6 + 16) >> 5
...
FF = (1*F1 + (-5)*F2 + 20*F3 + 20*F4 + (-5)*F5 + 1*F6 + 16) >> 5
Second step (vertical interpolation):
O = (1*AA + (-5)*BB + 52*CC + 20*DD + (-5)*EE + 1*FF + 32) >> 6
```

Yes, these tap_coef bits can be imagined as a char type data, signed and 8-bit width.

In this example,

```
STEP1_COEF_REG1.TAP_COEF1 should be configured as 1, so does
STEP1\_COEF\_REG1.TAP\_COEF2 = -5
STEP1\_COEF\_REG1.TAP\_COEF3 = 20
STEP1\_COEF\_REG1.TAP\_COEF4 = 20
STEP1\_COEF\_REG2.TAP\_COEF5 = -5
STEP1\_COEF\_REG2.TAP\_COEF6 = 1
STEP1_COEF_REG2.TAP_COEF7 not care
STEP1_COEF_REG2.TAP_COEF8 not care
STEP2\_COEF\_REG1.TAP\_COEF1 = 1
STEP2\_COEF\_REG1.TAP\_COEF2 = -5
STEP2\_COEF\_REG1.TAP\_COEF3 = 52
STEP2\_COEF\_REG1.TAP\_COEF4 = 20
STEP2\_COEF\_REG2.TAP\_COEF5 = -5
STEP2\_COEF\_REG2.TAP\_COEF6 = 1
STEP2_COEF_REG2.TAP_COEF7 not care
STEP2 COEF REG2.TAP COEF8 not care
```

So any types of filter like this format and under 8-tap, MC should be able to process them.

- 3. MPEG_HPEL case, these REGs are all not cared
- 4. H264 EPEL case,

```
Interpolated pixel = ((8 - X)*(8 - Y)*A1 + X*(8 - Y)*A2 + (8 - X)*Y*B1 + X*Y*B2 + 32) >> 6
```

Its obvious this operation also can be considered as a 2-tap filter.

```
STEP1_COEF_REG1.TAP_COEF1 = (8 - X)

STEP1_COEF_REG1.TAP_COEF2 = X

STEP2_COEF_REG1.TAP_COEF1 = (8 - Y)

STEP2_COEF_REG1.TAP_COEF2 = Y

Other TAP_COEF are all not cared
```

29.2.9 DMA Status/Command (DCS)

DCS 0x34

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Bits	Name	Description	RW
31:23	Reserved	Writing has no effect, read as zero.	R
22:16	DTC	Transfer number (not include node head and offset address)	R
		These bits can only be write by descriptor-DMA itself from descriptor	
		chain, so they are read-only for SW.	
15:10	Reserved	Writing has no effect, read as zero.	R
9	ND_DN	Current node need to inform host module configure done signal.	R
		1: inform.	
		0: not inform.	
		This bit can only be write by descriptor-DMA itself from descriptor	
		chain, so they are read-only for SW.	
8:7	ND_TYPE	Current descriptor node type	R
		00: Data node	
		01: offset node	
		10: address node	
		11: reserved	
		These bits can only be write by descriptor-DMA itself from descriptor	
		chain, so they are read-only for SW.	
6	ND_HSK	Next node handshake flag	R
		0: no handshake	
		1: handshake	
		This bit can only be write by descriptor-DMA itself from descriptor chain,	
		so they are read-only for SW.	
5	CKG	Sync node following flag	R
		0: Have Sync node following	
		1: Normal descriptor node following or current node is the ending-node	
		This bit can only be write by descriptor-DMA itself from descriptor chain,	
		so they are read-only for SW.	
4	ND_CY	Next node start address	R
		0: next node start from previous transfer	
		1: next node start from DHA	
		This bit can only be write by descriptor-DMA itself from descriptor chain,	
		so they are read-only for SW.	
3	ND_LINK	Ending-node flag	R
		0: no more node	
		1: go on link	

		This bit can only be write by descriptor-DMA itself from descriptor chain, so they are read-only for SW.	
2	TT	Task complete flag	RW
		0: task in processing	
		1: whole descriptor-chain task end	
		Clear TT when startup MC descriptor-DMA otherwise it would not start	
1	Reserved	Writing has no effect, read as zero.	R
0	DMAE	Set 1 to startup descriptor-chain transfer, and clear 0 when TT set	RW

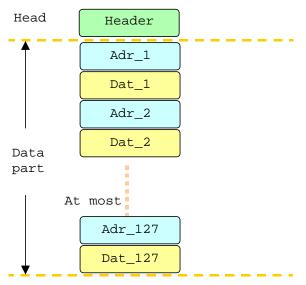

Note:

- 1. MC Descriptor-DMA introduce
 - MC Descriptor-DMA is used for MC's self-configuration. In video decoding, SW can create a task gather named descriptor table which including one or several descriptor chains. Each chain severs for one task.
- Descriptor-table structure
 DCS.ND_TYPE indicates 3 type descriptor chain node types: data node, offset node and address node.

Data Node

Address/Offset Node

Header stores the descriptor-line information: line length and whether repeat and link.

Adr_1 ~ Adr_n stores the register offset be configured or address to be written.

Dat_1 ~ Dat_n stores the configure/written data as well.

3. Descriptor Node Structure

Word	Bit	Name	Function
0th (FLAG)	31:0	Head flag	Indicates current is a head, it must be set as
			0x8000_0000
1th (HCFG)	31:24	CSA	Descriptor-DMA config MC register start address,
			it is only used in data node type. More details
			please reference to the following example.
	23	Reserved	
	22:16	DTC	Transfer Counter, 1-word unit
	15:7	Reserved	
	6	ND_DN	Always needs be configed as 1
	5:4	ND_TYPE	Current descriptor node type
			00: Data node 01: offset node
			10: address node 11: reserved
	3	ND_HSK	Next node handshake flag
			0: no handshake 1: handshake
	2	ND_CKG	Sync node following flag
			0: Have Sync node following
			1: Normal descriptor node following or
			current node is the ending-node
	1	CY	Cycle Chain, return to first node
	0	LINK	Indicator, if there are more nodes
			Data/Address/Offset

4. Descriptor Node example

```
mc_chain[] = {
    /*offset node*/
    0x80000000; /*head flag*/
    0x0002005D; /*number: 2, offset type, handshake, normal node followed, link*/
    0xC;
                 /*MC register offset, 0xC: MC_CUR_ADDR*/
    0xF4003000; /*MC current address needs be set to 0xF4003000*/
                /*MC register offset, 0x4: MC_STATUS*/
    0x4;
    0x0;
                /*Clear MC END_FLAG to startup MC*/
   /*data node*/
    0x80000000; /*head flag*/
    0x00820048; /*CSA set as 0x8, start from 0x8 dec to 0x4; unlink: next is sync node*/
    0x20000038; /*only data, this data would be set into MC_REF_ADDR */
                /*only data, this data would be set into MC_STATUS */
    0x0;
    /*address node*/
    0x80000000; /*head flag*/
    0x00010064; /*address node type, non-handshake; unlink: current is ending-node*/
    0xF4001000; /*only address */
               /*only data, 0x5a5a would be written into 0xF4001000*/
    0x5a5a;
};
```

Bits	Name	Description	RW
31:2	DHA	Descriptor Head Address	RW
1:0	Reserved	Writing has no effect, read as zero.	R

29.3 MC Configure Flow

Multi-Media Decoder's decoding flow

In the diagram above, different color rectangle stands for different decoding level. MC should be set at each level accordingly.

MC configure at decoder init process

In this step, only the information that would never be changed during the whole decoding process is configured.

Decoder Init process

Global information setting

- 1. Descriptor-Table init
- 2. DHA setting (DHA)

Only used in case of single descriptor-table (DHA need not be changed during the whole decoding process)

- 3. MC ending flag's setting (MC_STAT.BLK_END)
- 4. MC Filter TAP coefficients' setting

Only fit to those format with fixed filter such as MPEG_QPEL (STEP1_COEF_REG1 ~ STEP2_COEF_REG2)

5. Pixel position related information table init

Such as rounding value that is varied according to different sub-pixel's position, so it is recommend to store them into a table then look up to it in the following decoding process.

MC configure at frame decoding level

In this step, only the information that would never be changed during the current frame/slice decoding process is configured.

Decode frame

Frame level information setting

- 6. MC Cache flush
- 7. **Stride information's setting (FRM_STRD & BUFF_STRD)**It is required that all the stride value should be word-aligned.
- 8. Pixel position related information table init

Some pixel position related information value maybe changed across frame level, but its stable inner a frame's decoding process. Such as rounding value of MPEG_HPEL, it may change between 0 and 1 in different frames.

MC configure at MB decoding level

This level is the basic cell of MC configuration since most information is changed from MB to MB. So basic configure parameters such as block size, sub-pixel position, reference block address and destination block address are all set here.

And since descriptor-DMA is embedded, actually most of the work here is to fill the relative configure parameters into the descriptor table. One MB trigger descriptor-DMA once by configuring DCS, then descriptor-DMA starts working and MC would be configured and run with blocks of the MB in turn.

Decode Macro-Block

MB level information setting

9. Polling last MB's interpolation ending (MC_STAT)

Block Level

Block level information setting

12. Descriptor - node setting (in descriptor table)

Connect or break descriptor line according to current block's position

13. Block information REG (BLK_INFO)

Block size, interpolate format, whether need bi-direction average

14. Interpolate Information REG (ITP_INFO)

Filter rounding value, sub-pixel position, pixel rounding value, frame rounding value

15. Filter tap coefficients setting (STEP1_COEF_REG1

~ STEP2_COEF_REG2)

Only in case of different sub-pixel position having different tap coefficients such as RV9 QPEL

- 16. Reference block address (REF_ADDR)
- 17. Current block address (CURR_ADDR)

10. DHA setting (DHA)

Only set in multi descriptor table case, otherwise this work is done in decoder init process.

11. DCS setting (DCS)

Set this register to trigger descriptor-DMA, then MC would be configured according to descriptor table and MC main FSM works.

MC configuration example

- -- Interpolate format: MPEG Quarter-pixel
- -- Motion Vector number: 1MV
 - 1. In decoder init part we do these:

```
/*Create and init the descriptor table*/
unsigned int *dspt_table;
//---- Y block -----
// descriptor node: 6 means 6 parameters; link
dspt_table[0] = 0x6005D;
// specify REF_ADDR register (register offset value, here it is 0x8)
dspt_table[1] = REF_ADDR;
// dspt_table[2] will fill REF_ADDR value in MB decoding part
// specify CURR_ADDR register
dspt_table[3] = CURR_ADDR;
//dspt_table[4] fill CURR_ADDR value, suppose a buffer allocated in TCSM
dspt_table[4] = TCSM_Y_BUFFER;
// specify BLK_INFO register
dspt_table[5] = BLK_INFO;
// BLK_INFO value: 0x10F (MPEG_QPEL, 16x16 block)
dspt_table[6] = 0x10F;
// specify ITP_INFO register
dspt_table[7] = ITP_INFO;
//dspt_table[8] fill ITP_INFO value in MB decoding part
// specify CURR_STRD register
dspt_table[9] = CURR_STRD;
//dspt_table[10] fill CURR_STRD value in frame decoding part
// specify MC_STAT register
dspt_table[11] = MC_STAT;
//dspt_table[12] clear MC_STAT ending flag and MC start working
dspt_table[12] = 0x0;
//----- U block -----
dspt_table[13] = 0x6005D;
                               // descriptor node
dspt_table[14] = REF_ADDR;
dspt_table[16] = CURR_ADDR;
dspt_table[17] = TCSM_U_BUFFER;
dspt_table[18] = BLK_INFO; //(MPEG_HPEL, 8x8 block)
dspt_table[19] = 0x00A;
dspt_table[20] = ITP_INFO;
dspt_table[22] = CURR_STRD;
dspt_table[24] = MC_STAT;
```

```
dspt_table[25] = 0x0;
//---- V block -----
// descriptor node, not link here since it's the final block
dspt_table[26] = 0x3005C;
dspt_table[27] = REF_ADDR;
dspt_table[29] = CURR_ADDR;
dspt_table[30] = TCSM_V_BUFFER;
dspt_table[31] = MC_STAT;
dspt_table[32] = 0x0;
/*Set DHA*/
// set dspt_table start address to DHA
SET_DHA(dspt_table);
/*Set MC Ending Flag*/
SET_MC_FLAG(); //Set MC_STAT.BLK_END = 1
/*Enable MC, but MC would not run due to Ending Flag was set*/
                 //Set MC_CTRL.MC_EN = 1
MC_RUN();
/*Set MPEG_QPEL 8TAP Coefficients*/
SET_TAP_COEF(-1,3,-6,20,20,-6,3,-1);
// STEP1_COEF_REG1 ~ STEP2_COEF_REG2
```

1. In decoder frame part we do these:

```
/*MC Cache Flush*/
FLUSH_MCC(); //MC Cache must be flushed @ each frame's start decoding

/*Fill descriptor table with stride information*/
dspt_table[10] = Y_STRD;
dspt_table[23] = UV_STRD;
```

2. In decoder MB part we do these:

```
/*Polling MC Ending Flag*/
//Ensure last MB's interpolation has been finished
do {
} while ( REG(MC_STAT) != 0x3);
```

```
/*Fill descriptor table with relative block information*/
dspt_table[2] = Y_REF_ADDR_VAL;
dspt_table[8] = Y_ITP_INFO_VAL;
dspt_table[15] = U_REF_ADDR_VAL;
dspt_table[21] = U_ITP_INFO_VAL;
dspt_table[28] = V_REF_ADDR_VAL;
//Y_REF_ADDR_VAL ~ V_REF_ADDR_VAL are all decoded by the decoder

/*SET_DCS*/
SET_DCS(); // Set this register to trigger descriptor-DMA
```

MC configuration notes

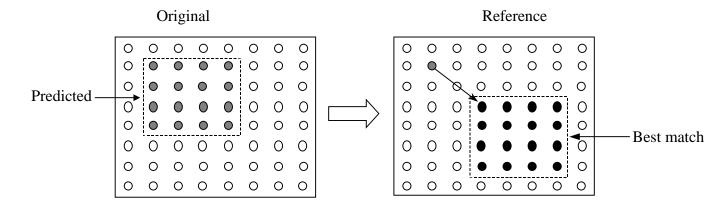

- 1. If MC descriptor-DMA is used, the descriptor chain table must be put in on-chip memory (TCSM).
- 2. If MC descriptor-DMA is used, during MC's running progress, any write operation to MC register by SW is forbidden; otherwise error result maybe get. So end flag polling is need for SW/HW sync.
- If MC descriptor-DMA is used, furthermore if no address node used for SW/HW sync, before SET_DCS() by SW to startup MC MC_STAT.DL_END must be cleared to ensure sync safety.
- 4. MC reference frame data must get from external SDRAM and reconstructed pixel can only write back to on-chip memory.

30 Motion Estimation

30.1 Overview

ME (Motion Estimation) is a hard block which can get the best match block of the current block by comparing the original picture and the reference picture. It is used for encoding and it has an independent DMA route.

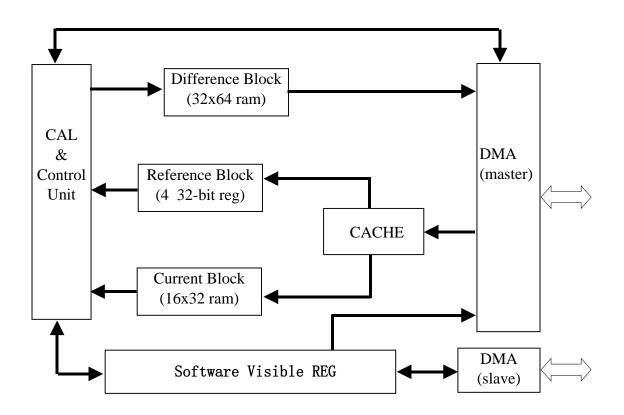

30.1.1 Features

- Input data: from external memory
- Output data: write back to external memory or internal SRAM
- Sharing Cache with MC
- Adopting Fast Diamond Algorithm to search the best matching block
- Programmable Max SAD Threshold and Max Search Steps
- Processing format:
 - --H.264 Full-pixel Luma prediction
 - --H.264 Full-pixel Chroma prediction
- Processing block size: 8x8

30.1.2 Block Diagram

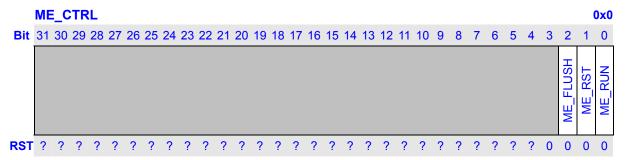

30.2 Register definition

The physical address base for the address-mapped registers of ME is 0x13090000.

30.2.1 ME Control Register

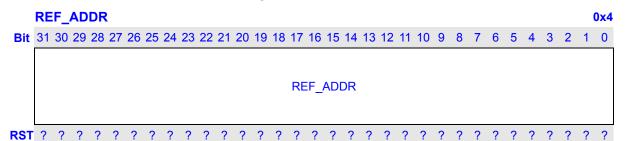

Bits	Name	Description	R/W
31:3	Reserved	Writing has no effect, read as zero.	R
2	ME_FLUSH	Clean Cache when it's high	W
1	ME_RST	Reset ME.	W
		Writing 1: reset ME;	
		0: no effect.	
0	ME_RUN	ME enable	RW
		1: enable; 0: disable	

NOTES:

Setting value 1 to ME_RST will reset all software visible ME registers immediately. It is not recommended that stopping ME abruptly by clearing ME_RUN when ME is running (ME_RUN=1), or writing value 1 to ME_RST when DMA (in or out) is working (ME_RUN=1), otherwise, the result is unpredictable.

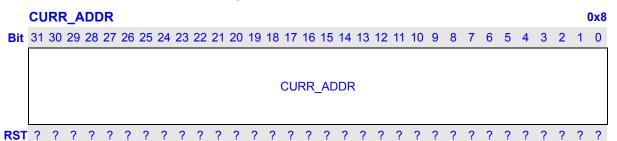

30.2.2 Reference Block Address Register

Bits	Name	Description	R/W
31:0	REF_ADDR	Reference block's start address	RW

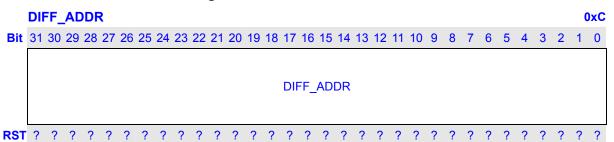

30.2.3 Current Block Address Register

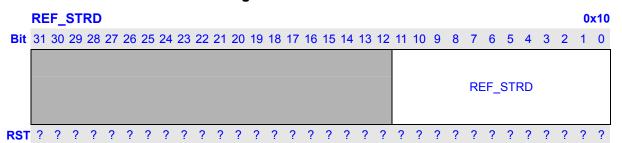

Bits	Name	Description	R/W
31:0	CURR_ADDR	Current block's start address	RW

30.2.4 Difference Address Register

Bits	Name	Description	R/W
31:0	DIFF_ADDR	Destination Address where the Difference Value is stored	RW

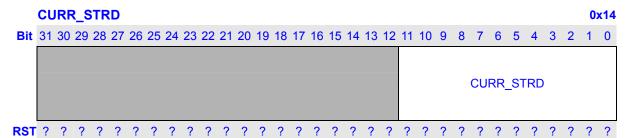

30.2.5 Reference Frame Stride Register

Bits	Name	Description	R/W
31:12	Reserved	Writing has no effect, read as zero.	R
11:0	REF_STRD	Reference frame's stride in the external memory. (Unit: byte)	RW

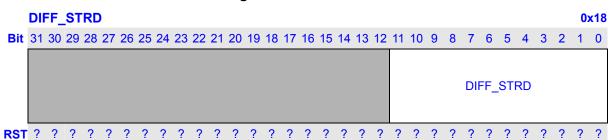

30.2.6 Current Frame Stride Register

Bits	Name	Description	R/W
31:12	Reserved	Writing has no effect, read as zero.	R
11:0	CURR_STRD	Current frame's stride in the external memory. (Unit: byte)	RW

30.2.7 Difference Frame Stride Register

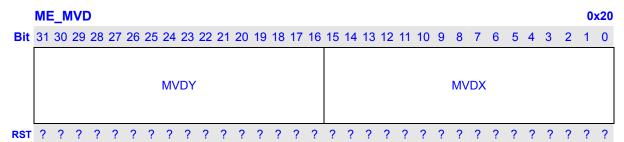

Bits	Name	Description							
31:12	Reserved	Writing has no effect, read as zero.	R						
11:0	DIFF_STRD	Difference frame's stride in the external memory. (Unit: byte)	RW						

30.2.8 ME Settings Register

Bits	Name	Description	R/W
31:16	SAD_GATE	The max SAD value which can be accepted	RW
15:6	Reserved	Writing has no effect, read as zero.	R
5:0	STEP_NUM	The max step number the search process can not exceed	RW

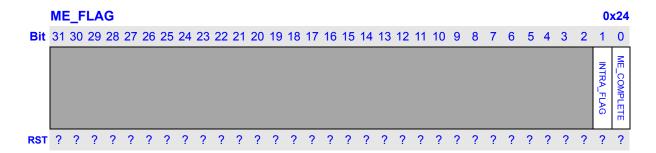

30.2.9 ME MVD Register

Bits	Name	Description	R/W
31:16	MVDY	The motion vector difference value of coordinate-Y	R
15:0	MVDX	The motion vector difference value of coordinate-X	R

30.2.10 ME FLAG Register

Bits	Name	Description	R/W
31:2	Reserved	Writing has no effect, read as zero.	R
1	INTRA_FLAG	Indicate the current MB will be predicted in intra mode	RW
0	ME_COMPLETE	It is set value 1 by hardware, and cleared by software	RW
		Indicate the end of search	
		0: It's not the end at current time, ME is proceeding	
		1: The ME of the current Part of the MB is completed	

31 De-Block

31.1 Overiew

31.1.1 Features

- Support h264 baseline and Rmvb89.
- Filter is done in macroblock unit, whose size is 16*16 or 8*8 byte.
- Filter order : Y -> U -> V -> Y ->

31.1.2 H.264 filter edge order in a MB:

16*16 MB:

	16	1	7	18	19	
0	20	4 2	8	22	12 23	
1		5 2	9		13 27	
2		6	10		14	
3	28	7	11	30	15	

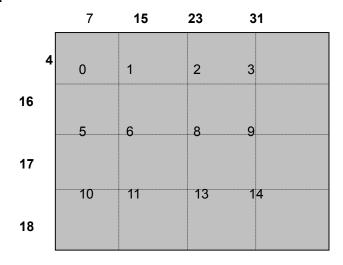

8*8 MB: Chroma components adopt boundary strength, which coming from above luma mb, every 2x2 block. When configue these 16 bs values to hardware, bs 0,1,2,3,8,9,10,11 would put into IO register BS_EDG_7_0 in the position as edge0, edge1, edge2,edge3,edge4,edge5,edge6,edge7. And bs 16,17,18,19,24,25,26,27 would put into IO register BS_EDG_23_16 as position described above. Refer to 31.4.5 and 31.4.8.

	16	17	18	19
0		8		
1	24	25 ⁹	26	27
2		10		
3		11		

31.1.3 RMVB filter order in a MB of:

16*16 MB:

8*8 MB:

		7	15
	4	1.	1
16			

31.2 IO Register Definition

The registers address are expressed at the offset to the deblock base address, 0x130B0000.

31.3 RMVB Register

31.3.1 Control Register

	DB	LK	_СТ	RL																								0>	130	B00	00+	-0x0

Bits	Name	Description	R/W
31	UPDATE_ADD	Highest priority. Only maintain the address, no transfer and	RW
	R	filtering behavior.	
30	TRAN_EVER	Do transfer forever even the block needn't fiter.	RW
29	MBOUT_MNT	Whether auto maintain the mbout addr	RW
	N		
28	MBOUT_XCH	Indicate Maintain out_addr way. Only effective when	RW
	G	MBOUT_MNTN is enable.	
		1: exchange addr when get to mbnum	
		0: addr increment. Jump addr when get to mbnum	
27	MBOUT_WRA	Wrap incr way. Only effective when MBOUT_MNTN enabled	RW
	Р	and MBOUT_XCHG not enable.	
		1: Jump addr to first mb of this row when get to mbnum	
		0: Jump addr to first mb of next row when get to mbnum	
26	MBIN_MNTN	Whether auto maintain the mbin addr	RW
25	MBIN_XCHG	Indicate Maintain in_addr way. Only effective when	RW
		MBIN_MNTN is enable.	
		1: exchange addr when get to mbnum	
		0: addr increment. Jump addr when get to mbnum	
24	MBIN_WRAP	Wrap incr way. Only effective when MBIN_MNTN enabled and	RW
		MBIN_XCHG not enable.	
		1: Jump addr to first mb of this row when get to mbnum	
		0: Jump addr to first mb of next row when get to mbnum	
23	UP_OUT_MNT	Whether auto maintain the up_out addr	RW
	N		
22	UP_OUT_INC	Incr way. Only effective when UP_OUT_MNTN is enable.	RW
	R	1: incremental	

		0: incremental wrap	
21	UP_IN_MNTN	Whether auto maintain the up_in addr	RW
20	UP_IN_INCR	Incr way. Only effective when UP_IN_MNTN is enable.	RW
		1: incremental	
		0: incremental wrap	
19:11	Reserved	Writing has no effect, read as zero.	R
10:7	GRAND_FSM	Indicate the grand_fsm_r	
6	V_DIRTY	Indicate V MB is need filtered.	R
5	U_DIRTY	Indicate U MB is need filtered.	R
4	Y_DIRTY	Indicate Y MB is need filtered.	R
3	QCIF_BETA2	Indicate the frame is less than or equal to QCIF.	R
2	DBLK_END	Indicates the finish of current macro block filtering	RW
		0: current macro block has not finished deblock	
		1:Current macro block finished deblock	
		Note: Software can clear. Software and hardware can set	
		Software must clear dblk_end and set dblk_en in the same	
		time if it wants starting dblk. Software can also set this bit to	
		clocking gating internal module of deblock.	
1	DBLK_RST	Not Supported!	RW
		Don't reset through sw or dblk hardware inter-locked. Only set	
		with 0 value.	
0	DBLK_EN	deblock enable.	RW
		0:	
		1: enable deblock module	
		clear and set by software.	

31.3.2 Data Format Register

Bits	Name	Description	R/W
28:24	REFQP	Reference QP. Changed one time per frame.	RW
20:16	QP	QP of the MB.	RW

lr.	ngenic		
15	ROW_END	Indicate the end of row when mntn is enable.	RW
		1: mntn_cnt_r=1, and mntn_addr_r back to the row head	
		0: do nothing	
12:11	MB_SIZE	Indicates the source data macro block size::	RW
		01: 16*16	
		10: 8*8	
10:9	YUV_FLAG	current macro block is Y or U or V	RW
		00: V	
		01: Y	
		10: U	
8	INTER_EN	Enable internal boundaries filter of current macro block	RW
		0: not enable	
		1: enable	
7	UP_EN	Enable up boundary filter of current macro block	RW
		0:	
		1: enable	
6	LEFT_EN	Enable left boundary filter of current macro block	RW
		0:	
		1: enable	
5:4	FRAME_TYP	It could be 0 represent I frame;	
	E	1 represent P frame;	
		2 represent B frame.	
3	TOP_MBS	Indicates whether it is in the top macro block line in frame	RW
		0 no	
		1 yes rmvb use, mainly for dma	
2	LEFT_MBS	Indicates whether in the left mb line of frame	RW
		0 no	
		1 yes rmvb use	
1:0	VIDEO_FMT	source video format:	
		01: H.264	RW
		10: rmvb

	26	27	28	29	30	31	32	33	34	35	36	37	38	39	40	41	42	43	44	45	46	47	48	49	50	51
bS = 1	1	1	1	1	1	1	1	2	2	2	2	3	3	3	4	4	4	5	б	6	7	8	9	10	11	13
bS = 2	1	1	1	1	1	2	2	2	2	3	3	3	4	4	5	5	6	7	8	8	10	11	12	13	15	17
bS = 3	1	2	2	2	2	3	3	3	4	4	4	5	6	6	7	8	9	10	11	13	14	16	18	20	23	25

31.4.19 tc0' LUT

18*32bits

TC0_LUT0 ~ TC0_LUT17

0xD8 ~ 0x11C

Index a = $0\sim16$ and index a = 17 in one regiser. The low 16-bit value for even number index such as $0\sim16$, 18, 20 ... while the high 16-bit for odd number such as 17, 19, 21
